3.3 V ECL Quad Differential **Receiver**

MC100LVEL17

Description

The MC100LVEL17 is a 3.3 V ECL, quad differential receiver. The device is functionally equivalent to the E116 device with the capability of operation from either a -3.3 V or +3.3 V supply voltage.

Under open input conditions, the \overline{D} input will be biased at $V_{CC}/2$ and the D input will be pulled down to V_{EE}. This operation will force the Q output LOW and ensure stability.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to VBB as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 µF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Features

- 325 ps Propagation Delay
- High Bandwidth Output Transitions
- The 100 Series Contains Temperature Compensation
- PECL Mode Operating Range: V_{CC} = 3.0 V to 3.8 V with $V_{EE} = 0 V$
- NECL Mode Operating Range: $V_{CC} = 0 V$ with $V_{EE} = -3.0$ V to -3.8 V
- Internal Input Pulldown Resistors D Inputs; Pullup and Pulldown on \overline{D} Inputs
- Q Output will Default LOW with Inputs Open or at VEE
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

ORDERING INFORMATION

Device	Package	Shipping [†]
MC100LVEL17DWR2G	SOIC-20 WB (Pb-Free)	1000 / Tape & Reel

+For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

* All V_{CC} pins are tied together on the die.

Warning: All V_{CC} and V_{EE} pins must be externally connected to Power Supply to guarantee proper operation.

Table 4. LVPECL DC CHARACTERISTICS (V_{CC} = 3.3 V; V_{EE} = 0.0 V (Note 1))

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary ±0.3 V.
Outputs are terminated through a 50 Ω resistor to V_{CC} – 2.0 V.
V_{IHCMR} min varies 1:1 with V_{EE}, max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP}min and 1 V.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

1. V_{EE} can vary ±0.3 V.

2. Skews are valid across specified voltage range, part-to-part skew is for a given temperature.

3. Duty cycle skew is the difference between a t_{PLH} and t_{PHL} propagation delay through a device.

4. V_{PP}(min) is minimum input swing for which AC parameters guaranteed. The device has a DC gain of ≈ 40.
