

## LM4925 Boomer™ Audio Power Amplifier Series 2 Cell, Single Ended Output, 40mW Stereo Headphone Audio Amplifier

Check for Samples: [LM4925](#)

### FEATURES

- BTL Mode for Mono Speaker
- 2-Cell 1.5V to 3.6V Battery Operation
- Single Ended Headphone Operation with Output Coupling Capacitors
- Unity-Gain Stable
- “Click and Pop” Suppression Circuitry for Both Shutdown and Mute
- Active Low Micro-Power Shutdown
- Active-Low Mute Mode
- Thermal Shutdown Protection Circuitry

### APPLICATIONS

- Portable Two-Cell Audio Products
- Portable Two-Cell Electronic Devices

### KEY SPECIFICATIONS

- Mono-BTL Output Power
  - ( $R_L = 8\Omega$ ,  $V_{DD} = 3.0V$ , THD+N = 1%), 410mW (Typ)
- Single Ended Output Power Per Channel,
  - ( $R_L = 16\Omega$ ,  $V_{DD} = 3.0V$ , THD+N = 1%), 40mW (Typ)
- Micropower Shutdown Current, 0.1 $\mu$ A (Typ)
- Supply Voltage Operating Range, 1.5V <  $V_{DD}$  < 3.6V
- PSRR 100Hz,  $V_{DD} = 3V$ , BTL, 70dB (Typ)

### DESCRIPTION

The unity gain stable LM4925 is both a mono differential output (for BTL operation) audio amplifier and a Single Ended (SE) stereo headphone amplifier. Operating on a single 3V supply, the mono-BTL mode delivers 410mW into an 8 $\Omega$  load at 1% THD+N. In Single Ended stereo headphone mode, the amplifier delivers 40mW per channel into a 16 $\Omega$  load at 1% THD+N.

With the LM4925 packaged in the VSSOP and SON packages, the customer benefits include low profile and small size. This package minimizes PCB area and maximizes output power.

The LM4925 features circuitry that reduces output transients (“clicks” and “pops”) during device turn-on and turn-off, an externally controlled, low-power consumption, active-low shutdown mode, and thermal shutdown. Boomer audio power amplifiers are designed specifically to use few external components and provide high quality output power in a surface mount package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings<sup>(1)(2)</sup>

Supply Voltage		3.8V	
Storage Temperature		-65°C to +150°C	
Input Voltage		-0.3V to V <sub>DD</sub> +0.3V	
Power Dissipation <sup>(3)</sup>		Internally limited	
ESD Susceptibility <sup>(4)</sup>		2000V	
ESD Susceptibility <sup>(5)</sup>		200V	
Junction Temperature		150°C	
Solder Information	Small Outline Package Vapor	Phase (60sec)	215°C
		Infrared (15 sec)	220°C
Thermal Resistance		$\theta_{JA}$ (typ) DGS	175°C/W
		$\theta_{JA}$ (typ) DSC0010A	73°C/W

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not ensure specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which ensure specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not ensured for parameters where no limit is given, however, the typical value is a good indication of device performance.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) The maximum power dissipation is dictated by T<sub>JMAX</sub>,  $\theta_{JA}$ , and the ambient temperature T<sub>A</sub> and must be derated at elevated temperatures. The maximum allowable power dissipation is P<sub>DMAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>)/ $\theta_{JA}$ . For the LM4925, T<sub>JMAX</sub> = 150°C. For the  $\theta_{JA}$ s, please see the [Application Information](#) section or the [Absolute Maximum Ratings](#) section.
- (4) Human body model, 100pF discharged through a 1.5k $\Omega$  resistor.
- (5) Machine model, 220pF–240pF discharged through all pins.

### Operating Ratings

Temperature Range	T <sub>MIN</sub> ≤ T <sub>A</sub> ≤ T <sub>MAX</sub>	-40°C ≤ T <sub>A</sub> ≤ +85°C
	Supply Voltage	1.5V ≤ V <sub>DD</sub> ≤ 3.6V

**Electrical Characteristics  $V_{DD} = 3.0V^{(1)(2)}$** 

The following specifications apply for the circuit shown in [Figure 4](#) for Single Ended Outputs ( $A_V = 2.5V$ ) and [Figure 5](#) for BTL Outputs ( $A_{V,BTL} = 2$ ), unless otherwise specified. Limits apply for  $T_A = 25^\circ C$ .

## APPLICATION INFORMATION

### BRIDGE (BTL) CONFIGURATION EXPLANATION

The LM4925 is a stereo audio power amplifier capable of operating in bridged (BTL) mode. As shown in [Figure 5](#), the LM4925 has two internal operational amplifiers. The first amplifier's gain is externally configurable, while the second amplifier should be externally fixed in a unity-gain, inverting configuration. The closed-loop gain of the first amplifier is set by selecting the ratio of  $R_f$  to  $R_i$  while the second amplifier's gain is fixed by the two external 20k $\Omega$  resistors. [Figure 5](#) shows that the output of amplifier one serves as the input to amplifier two which results in both amplifiers producing signals identical in magnitude, but out of phase by 180°. Consequently, the differential gain for the IC is

$$A_{VD} = 2 * (R_f / R_i) \quad (1)$$

By driving the load differentially through outputs VoA and VoB, an amplifier configuration commonly referred to as "bridged mode" is established. Bridged mode operation is different from the classical single-ended amplifier configuration where one side of the load is connected to ground. A bridge amplifier design has a few distinct advantages over the single-ended configuration, as it provides differential drive to the load, thus doubling output swing for a specified supply voltage. Four times the output power is possible as compared to a single-ended amplifier under the same conditions. This increase in attainable output power assumes that the amplifier is not current limited or clipped. In order to choose an amplifier's closed-loop gain without causing excessive clipping, please refer to the [AUDIO POWER AMPLIFIER DESIGN](#) section.

A bridge configuration, such as the one used in LM4925, also creates a second advantage over single-ended amplifiers. Since the differential outputs, VoA and VoB, are biased at half-supply, no net DC voltage exists across the load. This eliminates the need for an output coupling capacitor which is required in a single supply, single-ended amplifier configuration.

### MODE SELECT DETAIL

The LM4925 can be configured for either single ended (see [Figure 4](#)) or BTL mode (see [Figure 5](#)). When the  $\overline{SE/BTL}$  pin has a logic high ( $V_{DD}$ ) applied to it, the LM4925 is in BTL mode. If a logic low (GND) is applied to  $\overline{SE/BTL}$ , the LM4925 operates in single-ended mode. The slew rate of  $V_{DD}$  must be greater than 2.5V/ms to ensure reliable Power on reset (POR). The circuit shown in [Figure 30](#) presents an applications solution to the problem of using different supply voltages with different turn-on times in a system with the LM4925. This circuit shows the LM4925 with a 25-50k $\Omega$ . Pull-up resistor connected from the shutdown pin to  $V_{DD}$ . The shutdown pin of the LM4925 is also being driven by an open drain output of an external microcontroller on a separate supply. This circuit ensures that shutdown is disabled when powering up the LM4925 by either allowing shutdown to be high before the LM4925 powers on (the microcontroller powers up first) or allows shutdown to ramp up with  $V_{DD}$  (the LM4925 powers up first). This will ensure the LM4925 powers up properly and enters the correct mode of operation (BTL or SE). Please note that the  $\overline{SE/BTL}$  pin should be tied to GND for single-ended (SE) mode, and to Vdd for BTL mode.

**Figure 30. Recommended Circuit for Different Supply Turn-On Timing**

## POWER DISSIPATION

Power dissipation is a major concern when designing a successful amplifier, whether the amplifier is bridged (BTL) or single-ended. A direct consequence of the increased power delivered to the load by a bridge amplifier is an increase in internal power dissipation. Since the LM4925 has two operational amplifiers in one package, the maximum internal power dissipation in BTL mode is 4 times that of a single-ended amplifier. The maximum power dissipation for a given application can be derived from the power dissipation graphs or from [Equation 2](#).

$$P_{\text{DMAX}} = 4 * (V_{\text{DD}})^2 / (2\pi^2 R_L) \quad (2)$$

When operating in single ended mode, [Equation 3](#) states the maximum power dissipation point for a single-ended amplifier operating at a given supply voltage and driving a specified output load.

$$P_{\text{DMAX}} = (V_{\text{DD}})^2 / (2\pi^2 R_L) \quad (3)$$

Since the LM4925 has two operational amplifiers in one package, the maximum internal power dissipation point is twice that of the number that results from [Equation 3](#).

The maximum power dissipation point obtained from either [Equation 2](#) or [Equation 3](#) must not be greater than the power dissipation that results from [Equation 4](#):

$$P_{\text{DMAX}} = (T_{\text{JMAX}} - T_{\text{A}}) / \theta_{\text{JA}} \quad (4)$$

For package DGS,  $\theta_{\text{JA}} = 175^\circ\text{C/W}$ .  $T_{\text{JMAX}} = 150^\circ\text{C}$  for the LM4925. Depending on the ambient temperature,  $T_{\text{A}}$ , of the system surroundings, [Equation 4](#) can be used to find the maximum internal power dissipation supported by the IC packaging. If the result of [Equation 2](#) or [Equation 3](#) is greater than that of [Equation 4](#), then either the supply voltage must be decreased, the load impedance increased or  $T_{\text{A}}$  reduced. For the typical application of a 3.0V power supply, with an  $16\Omega$  load, the maximum ambient temperature possible without violating the maximum junction temperature is approximately  $129^\circ\text{C}$  provided that device operation is around the maximum power dissipation point. Thus, for typical applications, power dissipation is not an issue. Power dissipation is a function of output power and thus, if typical operation is not around the maximum power dissipation point, the ambient temperature may be increased accordingly. Refer to the [Typical Performance Characteristics](#) curves for power dissipation information for lower output powers.

## POWER SUPPLY BYPASSING

As with any amplifier, proper supply bypassing is important for low noise performance and high power supply rejection. The capacitor location on the power supply pins should be as close to the device as possible. Typical applications employ a battery (or 3.0V regulator) with  $10\mu\text{F}$  tantalum or electrolytic capacitor and a ceramic bypass capacitor that aid in supply stability. This does not eliminate the need for bypassing the supply nodes of the LM4925. A bypass capacitor value in the range of  $0.1\mu\text{F}$  to  $4.7\mu\text{F}$  is recommended.

## MICRO POWER SHUTDOWN

The voltage applied to the SHUTDOWN pin controls the LM4925's shutdown function. Activate micro-power shutdown by applying a logic-low voltage to the SHUTDOWN pin. When active, the LM4925's micro-power shutdown feature turns off the amplifier's bias circuitry, reducing the supply current. A voltage that is higher than ground may increase the shutdown current. There are a few ways to control the micro-power shutdown. These include using a single-pole, single-throw switch, a microprocessor, or a microcontroller. When using a switch, connect an external 100k $\Omega$  pull-up resistor between the SHUTDOWN pin and  $V_{DD}$ . Connect the switch between the SHUTDOWN pin and ground. Select normal amplifier operation by opening the switch. Closing the switch connects the SHUTDOWN pin to ground, activating micro-power shutdown. The switch and resistor ensure that the SHUTDOWN pin will not float. This prevents unwanted state changes. In a system with a microprocessor or microcontroller, use a digital output to apply the control voltage to the SHUTDOWN pin. Driving the SHUTDOWN pin with active circuitry eliminates the pull-up resistor. Shutdown enable/disable times are controlled by a combination of  $C_{bypass}$  and  $V_{DD}$ . Larger values of  $C_{bypass}$  results in longer turn on/off times from Shutdown. Longer shutdown times also improve the LM4925's resistance to click and pop upon entering or returning from shutdown. For a 3.0V supply and  $C_{bypass} = 4.7\mu\text{F}$ , the LM4925 requires about 2 seconds to enter or return from shutdown. This longer shutdown time enables the LM4925 to have virtually zero pop and click transients upon entering or release from shutdown. Smaller values of  $C_{bypass}$  will decrease turn-on time, but at the cost of increased pop and click and reduced PSRR. When the LM4925 is in shutdown, the outputs become very low impedance (less than 5 $\Omega$  to GND).

## MUTE

The LM4925 also features a mute function that enables extremely fast turn-on/turn-off with a minimum of output pop and click. The mute function leaves the outputs at their bias level, thus resulting in higher power consumption than shutdown mode, but also provides much faster turn on/off times. Providing a logic low signal on the MUTE pin enables mute mode. Threshold voltages and activation techniques match those given for the shutdown function as well.

## PROPER SELECTION OF EXTERNAL COMPONENTS

Proper selection of external components in applications using integrated power amplifiers is critical to optimize device and system performance. While the LM4925 is tolerant of external component combinations, consideration to component values must be used to maximize overall system quality. The LM4925 is unity-gain stable that gives the designer maximum system flexibility. The LM4925 should be used in low gain configurations to minimize THD+N values, and maximize the signal to noise ratio. Low gain configurations require large input signals to obtain a given output power. Input signals equal to or greater than 1V<sub>rms</sub> are available from sources such as audio codecs. Very large values should not be used for the gain-setting resistors. Values for  $R_i$  and  $R_f$  should be less than 1M $\Omega$ . Please refer to the section, [AUDIO POWER AMPLIFIER DESIGN](#), for a more complete explanation of proper gain selection. Besides gain, one of the major considerations is the closed-loop bandwidth of the amplifier. To a large extent, the bandwidth is dictated by the choice of external components shown in [Figure 4](#) and [Figure 5](#). The input coupling capacitor,  $C_i$ , forms a first order high pass filter that limits low frequency response. This value should be chosen based on needed frequency response and turn-on time.

## SELECTION OF INPUT CAPACITOR SIZE

Amplifying the lowest audio frequencies requires a high value input coupling capacitor,  $C_i$ . A high value capacitor can be expensive and may compromise space efficiency in portable designs. In many cases, however, the headphones used in portable systems have little ability to reproduce signals below 60Hz. Applications using headphones with this limited frequency response reap little improvement by using a high value input capacitor. In addition to system cost and size, turn on time is affected by the size of the input coupling capacitor  $C_i$ . A larger input coupling capacitor requires more charge to reach its quiescent DC voltage. This charge comes from the output via the feedback. Thus, by minimizing the capacitor size based on necessary low frequency response, turn-on time can be minimized. A small value of  $C_i$  (in the range of 0.1 $\mu\text{F}$  to 0.47 $\mu\text{F}$ ), is recommended.

## AUDIO POWER AMPLIFIER DESIGN

### A 25mW/32Ω Audio Amplifier

Given:	
Power Output	10mWrms
Load Impedance	16Ω
Input Level	0.4Vrms
Input Impedance	20kΩ

A designer must first choose a mode of operation (SE or BTL) and determine the minimum supply rail to obtain the specified output power. By extrapolating from the Output Power vs. Supply Voltage graphs in the [Typical Performance Characteristics](#) section, the supply rail can be easily found. 3.0V is a standard voltage in most applications, it is chosen for the supply rail. Extra supply voltage creates headroom that allows the LM4925 to reproduce peak in excess of 10mW without producing audible distortion. At this time, the designer must make sure that the power supply choice along with the output impedance does not violate the conditions explained in the [POWER DISSIPATION](#) section. Once the power dissipation equations have been addressed, the required gain can be determined from [Equation 5](#).

$$A_V \geq \sqrt{(P_O R_L) / (V_{IN})} = V_{or\text{rms}} / V_{in\text{rms}} \quad (5)$$

From [Equation 5](#), the minimum AV is 1; use  $A_V = 1$ . Since the desired input impedance is 20k, and with a  $A_V$  gain of 1, a ratio of 1:1 results from [Equation 1](#) for  $R_f$  to R. The values are chosen with  $R_i = 20\text{k}$  and  $R_f = 20\text{k}$ . The final design step is to address the bandwidth requirements which must be stated as a pair of -3dB frequency points. Five times away from a -3dB point is 0.17dB down from passband response which is better than the required  $\pm 0.25\text{dB}$  specified.

$$f_L = 100\text{Hz} / 5 = 20\text{Hz}$$

$$f_H = 20\text{kHz} * 5 = 100\text{kHz}$$

As stated in the [PROPER SELECTION OF EXTERNAL COMPONENTS](#) section,  $R_i$  in conjunction with  $C_i$  creates a

$$C_i \geq 1 / (2\pi * 20\text{k}\Omega * 20\text{Hz}) = 0.397\mu\text{F}; \text{ use } 0.39\mu\text{F}.$$

The high frequency pole is determined by the product of the desired frequency pole,  $f_H$ , and the differential gain,  $A_V$ . With an  $A_V = 1$  and  $f_H = 100\text{kHz}$ , the resulting GBWP = 100kHz which is much smaller than the LM4925GBWP of 3MHz. This example displays that if a designer has a need to design an amplifier with higher differential gain, the LM4925 can still be used without running into bandwidth limitations.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LM4925MM/NOPB	VSSOP	DGS	10	1000	178.0	12.4	5.3	3.4	1.4	8.0	12.0	Q1
LM4925SD/NOPB	WSO8	DSC	10	1000	178.0	12.4	3.3	3.3	1.0	8.0	12.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LM4925MM/NOPB	VSSOP	DGS	10	1000	210.0	185.0	35.0
LM4925SD/NOPB	WSON	DSC	10	1000	210.0	185.0	35.0

DGS (S-PDSO-G10)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion.
  - D. Falls within JEDEC MO-187 variation BA.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
