TEST CONFIGURATIONS

Input Ripple Current & Output Noise

All models are tested and specified for input reflected ripple current and output noise as per layouts shown in Figures 1 & 2. The Cbus and Lbus components simulate a typical DC voltage bus. However, your specific system configuration may require additional considerations.

APPLICATION NOTES

Output Voltage Trimming

The output voltage can be adjusted by using the trim pin and a single fixed resistor (see Figures 4 & 5). Trimming resistors should have a low temperature coefficient (± 100 ppm/ $^{\circ}\text{C}$ or less) and be mounted close to the converter. If the trim function is not needed, leave the trim pin open.

Figure 4 Trim Adjustments To Decrease Output Voltage Using A Fixed Resistor

Figure 5 Trim Adjustments To Increase Output Voltage Using A Fixed Resistor

$$R_{trim - up} = \frac{A}{V_o - V_{o, nom}} - B$$

$$R_{trim - down} = \frac{C(V_o - 2.5)}{V_{o, nom} - V_o} - B$$

Note: $R_{trim-up}$ is the external resistor in Ω
 $R_{trim-down}$ is the external resistor in Ω
 $V_{o, nom}$ is the nominal output voltage
 V_o is the desired output voltage

5	12775	2050	5110
12	25000	5110	10000

Remote On/Off Control

The DC-DC converter can be ordered with either positive or negative logic. See page 2 for enable/disable details for both positive and negative logic options. Dynamic control of the On/Off function should be able to sink appropriate signal current when brought low and withstand appropriate voltage when brought high. Be aware that there is a finite time in milliseconds between the the time of On/Off control activation and stable, regulated output. This time will vary slightly with output load type and current and input conditions.

Cautions when using the On/Off control:

1. To retain full output circuit isolation, control the On/Off from the input side only.
2. While it is possible to control the On/Off with external logic if you carefully observe the voltage levels, the preferred circuit is either an open drain/open collector transistor, a switch, or a relay.
3. Do not apply voltages to the On/Off pin when there is no input power voltage, otherwise the converter may be permanently damaged.
