

# Four Outputs PCI-Express Clock Generator

## Features

- 25 MHz Crystal or Clock Input
- Four Differential 100 MHz PCI-Express Clocks
- Supports HCSL Compatible Output Levels
- One Single-ended 25 MHz Output
- Spread Spectrum Capability on all 100 MHz PCI-Express Clock Outputs
- SMBus Interface with Read Back Capability
- 32-pin QFN Package
- Operating Voltage 3.3 V
- Commercial and Industrial Operating Temperature Range

## Functional Description

CY24292 is a clock generator device intended for PCI-Express applications. The device includes: four 100 MHz differential clocks with HCSL Compatible outputs for PCI-Express, and one single-ended 25 MHz output.

Using a serially programmable SMBus interface, the CY24292 incorporates spread spectrum modulation on all four 100 MHz outputs. The device incorporates a Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction. The spread feature or individual outputs can also be disabled using the SMBus interface.

## Pin Configuration

Figure 1. 32-pin QFN Pinout CY24292

## Pin Definitions

Pin Number	Pin Name	Pin Type	Description
1	PCIE1P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
2	PCIE1N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
3	GND	Power	Ground
4	IREF	Output	Current set for all differential clock drivers. Connect 475 Ω resistor to ground.
5	PCIE2N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
6	PCIE2P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
7	GND	Power	Ground
8	VDD	Power	3.3 V Power supply
9	PCIE3N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
10	PCIE3P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
11	VDD	Power	3.3 V Power supply
12	PCIE0P	Output	Differential 100 MHz PCI-Express true clock output. High impedance when disabled.
13	PCIE0N	Output	Differential 100 MHz PCI-Express complementary clock output. High impedance when disabled.
14	SCLK	Input	SMBus clock input
15	SDATA	Input	SMBus data input
16	VDD	Power	3.3 V Power supply
17	GND	Power	Ground

**Pin Definitions** (continued)

Pin Number	Pin Name	Pin Type	Description
18	VDD	Power	3.3 V Power supply
19	GND	Power	Ground
20	PD_RESET#	Input	Global reset pin. Powers down PLLs, disables outputs and sets the SMBus tables to their default state when pulled low. Has internal weak pull up.
21	VDD	Power	3.3 V Power supply
22	XIN/EXCLKIN	Input	Crystal or clock input. Connect to 25 MHz fundamental mode crystal or clock.
23	XOUT	Output	Crystal output. Connect to 25 MHz fundamental mode crystal. Float for clock input.
24	VDD	Power	3.3 V Power supply
25	NC	–	No connect. Pin has no internal connection.
26	25M	Output	25 MHz Single-ended LVCMOS output. Pull-down when disabled by PD_RESET#. Driven low when individually disabled (via SMBus byte 0, bit 0).
27	GND	Power	Ground
28	VDD	Power	3.3 V Power supply
29	GND	Power	Ground
30	VDD	Power	3.3 V Power supply
31	GND	Power	Ground
32	VDD	Power	3.3 V Power supply

**Functional Overview**
**SMBus Serial Data Interface**

A two-signal serial interface is provided to enhance the flexibility and function of the clock synthesizer. Through the serial data interface, various device functions such as clock output buffers can be individually enabled or disabled. The registers associated with the serial data interface initialize to their default setting upon power up, and therefore this interface is optional. Clock device register changes are normally made upon system initialization, if required. This is a RAM-based technology which does not keep its value when power is off or during a power transition.

**Data Protocol**

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write and read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in [Table 1](#).

The block write and block read protocol is outlined in [Table 2 on page 5](#), while [Table 3 on page 5](#) outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h) for write and 11010011 (D3h) for read.

**Table 1. Command Code Definition**

Bit	Description
7	0 = block read or block write operation, 1 = byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits must be '000000'

**Table 2. Block Read and Block Write Protocol**

Block Write Protocol		Block Read Protocol

Bit	Type	At Power up	Outputs Affected	Description	Notes
0 to 7	R	Undefined	Not applicable	Not used	

The state of the clock outputs upon assertion of the PD\_RESET# signal from input pin or Global OE control bit from byte 0, bit 5 of the SMBus is shown in the following table.

**Table 11. Power Down Reset Table**

H/W PD_RESET# (pin 24)	S/W PD_RESET# (Byte 0 bit 5)	All Clock Outputs
0	0	Disabled, Hi-Z. 25M has weak pull-down.
0	1	Disabled, Hi-Z. 25M has weak pull-down.
1	0	Disabled, Hi-Z. 25M has weak pull-down.
1	1	Enabled

## Application Information

### Crystal Recommendations

The CY24292 requires a parallel resonance crystal. Substituting a series resonance crystal causes the CY24292 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300 ppm frequency shift between the series and parallel crystals due to incorrect loading.

**Table 12. Crystal Recommendations**

Frequency	Cut	Load Cap (max)	Eff Series Rest (max)	Drive (max)	Tolerance (max)	Stability (max)	Aging (max)
25.00 MHz	Parallel	16 pF	30 Ω	1.0 mW	30 ppm	10 ppm	5 ppm/yr

### Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, consider the total capacitance the crystal sees to calculate the appropriate capacitive loading (CL).

Figure 2 shows a typical crystal configuration using two trim capacitors. It is important to note that the trim capacitors in series with the crystal are not parallel. It is a common misconception that load capacitors are in parallel with the crystal and are approximately equal to the load capacitance of the crystal. This is not true.

### Calculating Load Capacitors

In addition to the standard external trim capacitors, the trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading.

As mentioned in the previous section, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, the trim capacitors (Ce1, Ce2) must be calculated to provide equal capacitive loading on both sides.

**Figure 2. Crystal Loading Example**

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

#### Load capacitance (each side)

$$C_e = 2 * CL - (C_s + C_i)$$

#### Total capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left( \frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}} \right)}$$

- CL ..... Crystal load capacitance
- CLe ..... Actual loading seen by crystal using standard value trim capacitors
- Ce ..... External trim capacitors
- Cs ..... Stray capacitance (terraced)
- Ci ..... Internal capacitance

### Current Source (Iref) Reference Resistor

If the board target trace impedance (Z) is 50 Ω, then for RREF = 475 Ω (1%) provides IREF of 2.32 mA. The output current (IOH) is equal to 6 × IREF.

### Output Termination

The PCI-Express differential clock outputs of CY24292 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are explained in detail in the section [PCI-Express Layout Guidelines on page 9](#).

### PCB Layout Recommendations

For optimum device performance and lowest phase noise, the following guidelines must be observed.

1. Each 0.01  $\mu\text{F}$  decoupling capacitor must be mounted on the component side of the board as close to the VDD pin as possible.
2. No vias must be used between the decoupling capacitor and the VDD pin.
3. The PCB trace to the VDD pin and the ground via must be kept as short as possible. The distance of the ferrite bead and bulk decoupling from the device is less critical.

4. An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (any ferrite beads and bulk decoupling capacitors can be mounted on the back). Other signal traces must be routed away from the CY24292. This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

### Decoupling Capacitors

Decoupling capacitors of 0.01  $\mu\text{F}$  must be connected between VDD and GND as close to the device as possible. Do not share ground vias between components. Route power from power source through the capacitor pad, and then into the CY24292 pin.

## PCI-Express Layout Guidelines

### HCSL Compatible Layout Guidelines

Table 13. Common Recommendations for Differential Routing

Differential Routing <sup>[1]</sup>	Dimension or Value	Unit
L1 length, route as non-coupled 50 $\Omega$ trace	0.5 max	inch
L2 length, route as non-coupled 50 $\Omega$ trace	0.2 max	inch
L3 length, route as non-coupled 50 $\Omega$ trace	0.2 max	inch
$R_S$	33	$\Omega$
$R_T$	49.9	$\Omega$

Table 14. Differential Routing for PCI-Express Load or Connector

Differential Routing <sup>[1]</sup>	Dimension or Value	Unit
L4 length, route as coupled microstrip 100 $\Omega$ differential trace	2 to 32	inch
L4 length, route as coupled stripline 100 $\Omega$ differential trace	1.8 to 30	inch

Figure 3. PCI-Express Device Routing

**Note**

### Absolute Maximum Ratings

Parameter	Description	Condition	Min	Max	Unit
V <sub>DD</sub>	Supply voltage		-0.5	4.6	V
V <sub>IN</sub>	Input voltage	Relative to V <sub>SS</sub>	-0.5	V <sub>DD</sub> + 0.5	V
T <sub>S</sub>	Temperature, Storage	Non Operating	-65	150	°C
T <sub>J</sub>	Temperature, Junction		-	125	°C
ESD <sub>HBM</sub>	ESD Protection (Human Body Model)	JEDEC EIA/JESD22-A114-E	2000	-	V
UL-94	Flammability rating		V-0 at 1/8 in.		
MSL	Moisture sensitivity level		3		

### Recommended Operation Conditions

Parameter	Description	Min	Typ	Max	Unit
V <sub>DD</sub>	Supply voltage	3.0	-	3.6	V
T <sub>AC</sub>	Commercial ambient temperature	0	-	70	°C
T <sub>AI</sub>	Industrial ambient temperature	-40	-	85	°C
t <sub>PU</sub>	Power up time for all V <sub>DD</sub> to reach minimum specified voltage (power ramps must be monotonic)	0.05	-	500	ms
t <sub>PD</sub>	Minimum pulse width of PD_RESET# input	100	-	-	ns
V <sub>SMB</sub>	SMBus Voltage	3.0	-	3.6	V
R <sub>REFTOL</sub>	Tolerance on the 475Ω R <sub>REF</sub> resistor that sets output currents on 100MHz ports	-	-	1	%

## DC Electrical Characteristics

Unless otherwise stated,  $V_{DD} = 3.3 \text{ V} \pm 0.3 \text{ V}$ , ambient temperature =  $-40 \text{ }^\circ\text{C}$  to  $85 \text{ }^\circ\text{C}$  Industrial,  $0 \text{ }^\circ\text{C}$  to  $70 \text{ }^\circ\text{C}$  Commercial,  $R_{REF} = 475 \text{ } \Omega$

Parameter <sup>[2]</sup>	Description	Condition	Min	Typ	Max	Unit
$V_{OL1}$	Low level output voltage of 25M clock	$I_{OL} = 8 \text{ mA}$	–	–	0.4	V
$V_{OH1}$	High level output voltage of 25M clock	$I_{OH} = -8 \text{ mA}$	$V_{DD} - 0.4$	–	–	V
$V_{OL2}$	Low level output voltage of 100M clocks	HCSL termination ( $R_S = 33 \text{ } \Omega$ , $R_T = 49.9 \text{ } \Omega$ )	-0.2	0	0.05	V
$V_{OH2}$	High level output voltage of 100M clocks	HCSL termination ( $R_S = 33 \text{ } \Omega$ , $R_T = 49.9 \text{ } \Omega$ )	0.65	0.71	0.95	V
$V_{OL3}$	Low level output voltage SDATA	$I_{OL} = 4 \text{ mA}$	–	–	0.4	V
$I_{OH}$	Output high current for differential clocks	$I_{OH} = 6 \times I_{REF}$	-13	-15.2	-17	mA
$V_{IL1}$	Low level input voltage of SCLK, SDATA		-0.3	–	0.8	V
$V_{IH1}$	High level input voltage of SCLK, SDATA		2.1	–	$V_{DD} + 0.3$	V
$V_{IL2}$	Low level input voltage of XIN/EXCLKIN, PD_RESET# pins		-0.3	–	0.8	V
$V_{IH2}$	High level input voltage of XIN/EXCLKIN, PD_RESET# pins		2.0	–	$V_{DD} + 0.3$	V
$I_{DD}$	Operating supply current	No load, PD_RESET# pin = 1	–	50	70	mA
		Full load, PD_RESET# pin = 1	–	135	170	mA
$I_{DDPD}$	Power down current	PD_RESET# pin = 0	–	250	350	$\mu\text{A}$
$C_{IN}$	Input capacitance	All input pins	–	5	–	pF
$R_{PU}$	Pull up resistor, PD_RESET#		–	90	–	k $\Omega$
$R_{PD}$	Pull down resistor, 25M output	PD_RESET# = 0	50	–	150	k $\Omega$

## Thermal Resistance

Parameter <sup>[3]</sup>	Description	Test Conditions	32-pin QFN	Unit
$\theta_{JA}$	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	22	$^\circ\text{C}/\text{W}$
$\theta_{JC}$	Thermal resistance (junction to case)		19.5	$^\circ\text{C}/\text{W}$

### Notes

- Parameters are guaranteed by design and characterization. Not 100% tested in production.
- These parameters are guaranteed by design and are not tested.

## AC Electrical Characteristics

Unless otherwise stated,  $V_{DD} = 3.3\text{ V} \pm 0.3\text{ V}$ , ambient temperature =  $-40\text{ }^{\circ}\text{C}$  to  $85\text{ }^{\circ}\text{C}$  Industrial,  $0\text{ }^{\circ}\text{C}$  to  $70\text{ }^{\circ}\text{C}$  Commercial,  $R_{REF} = 475\ \Omega$ .

**Table 15. Single-Ended 25 MHz Output**

Parameter <sup>[4]</sup>	Description	Condition	Min	Typ	Max	Unit
$F_{IN}$	Input clock frequency (crystal or external clock)	–	–	25	–	MHz
$T_{INDC}$	Input clock duty cycle	–	40	–	60	%
$F_{OUT}$	Output clock frequency, 25M	–	–	25	–	MHz
$T_R$	Output rise time <sup>[5]</sup>	20% to 80% of VDD	–	0.5	1	ns
$T_F$	Output fall time <sup>[5]</sup>	80% to 20% of VDD	–	0.5	1	ns
$T_{DC}$	Output clock duty cycle <sup>[5]</sup>	Measured at VDD/2	45	50	55	%
$T_{CCJ}$	Cycle-to-cycle jitter <sup>[5]</sup>	–	–	–	200	ps
$T_{OEPD}$	Output enable from power down reset	PD_RESET# going high to 99% of final frequency	–	–	2	ms
$T_{LOCK}$	Clock stabilization from power up	Measured from 90% of the applied power supply level	–	1	2	ms

### Notes

4. Parameters are guaranteed by design and characterization. Not 100% tested in production.
5. Measured with Cload = 15 pF lumped load.

**Table 16. Differential 100 MHz, HCSL Terminated Outputs**

Parameter <sup>[6]</sup>	Description	Test Condition	Min	Typ	Max	Unit
F <sub>OUT</sub>	Output frequency		–	–	100	MHz
SP <sub>PROFILE</sub>	Spread modulation profile		–	–	Lexmark	type

T <sub>OE PD</sub>	Output enable from power down reset	PD_RESET# going high to 99% of final frequency	–	–	2	ms
T <sub>LOCK</sub>	Clock stabilization from power up	Measured from 90% of the applied power supply level	–	1	2	ms

**Notes**

6. Parameters are guaranteed by design and characterization. Not 100% tested in production.
7. Measurement taken from differential waveform (PCIEP minus PCIEN). Either single ended probes with math or a differential probe can be used.
8. Phase jitter is determined using data captured on an oscilloscope at a sample rate of 20 GS/sec, for a minimum 100,000 continuous clock periods. This data is then processed using the ClockJitter 1.3.0 software from PCISIG, using the PCI\_E\_1\_1 template.
9. Measured from -150 mV to +150 mV on the differential waveform (derived from PCIEP minus PCIEN). The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing.
10. Measurement taken from a single-ended waveform.
11. Measured at crossing point where the instantaneous voltage value of the rising edge of PCIEP equals the falling edge of PCIEN.
12. Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.
13. Defined as the total variation of all crossing voltages of Rising PCIEP and Falling PCIEN. This is the maximum allowed variance in V<sub>CROSS</sub> for any particular system.
14. PPM refers to parts per million and is a DC absolute period accuracy specification. 1 PPM is 1/1,000,000th of 100.000000 MHz exactly, or 100 Hz. For 300 PPM then we have an error budget of 30 kHz. The period is to be measured with a frequency counter with measurement window set to 100 ms or greater. The ±300 PPM applies to systems that do not employ Spread Spectrum or that use common clock source. For systems employing Spread Spectrum, there is an additional 2500 PPM nominal shift in maximum period resulting from the 0.5% down spread, resulting in a maximum average period specification of +2800 PPM.
15. Defined as the absolute minimum or maximum instantaneous period. This includes cycle-to-cycle jitter, relative PPM tolerance, and spread spectrum modulation.
16. Measured at the rising 0 V point of the differential signal. Skew is the time difference of the rising 0 V point between any two differential signal pairs. The measurement is taken over 1000 samples, and the average value is used.

## Test and Measurement Setup

### Ordering Information

Ordering Code	Package Type	Production Flow
<b>Pb-free</b>		
CY24292LFXC	32-pin QFN	Commercial, 0 °C to 70 °C
CY24292LFXCT	32-pin QFN – Tape and Reel	Commercial, 0 °C to 70 °C
CY24292LFXI	32-pin QFN	Industrial, –40 °C to 85 °C
CY24292LFXIT	32-pin QFN – Tape and Reel	Industrial, –40 °C to 85 °C

### Ordering Code Definitions

CY 24292 L X X X -xxx T

Package Diagram

Figure 6. 32-pin QFN (5 x 5 x 0.55 mm) LQ32 3.5 x 3.5 E-Pad (Sawn) Package Outline, 001-42168

NOTES:

1.  HATCH AREA IS SOLDERABLE EXPOSED PAD
2. BASED ON REF JEDEC # MO-248
3. PACKAGE WEIGHT: 0.0388g
4. DIMENSIONS ARE IN MILLIMETERS

001-42168 \*F

## Acronyms

Table 17. Acronyms Used in this Document

Acronym	Description
EIA	electronic industries alliance
EMI	electromagnetic interference
ESD	electrostatic discharge
HCSL	host clock signal level
JEDEC	joint electron devices engineering council
LVC MOS	low voltage complementary metal oxide semiconductor
OE	output enable
PCI	peripheral component interconnect
PLL	phase-locked loop
QFN	quad-flat no-leads
RAM	random access memory

## Document Conventions

### Units of Measure

Table 18. Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
kHz	kilohertz
kΩ	kilohm
MHz	megahertz
μF	microfarad
mA	milliampere
ms	millisecond
mV	millivolt
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
ppm	parts per million
ps	picosecond
V	volt

Document History Page

Document Title: CY24292, Four Outputs PCI-Express Clock Generator				
Document Number: 001-46142				
Rev.	ECN	Orig. of Change	Submission Date	Description of Change
**	2490167	PYG / DPF / AESA	See ECN	New data sheet.
*A	2507681	DPF / AESA	05/23/2008	Updated <a href="#">Pin Configuration</a> (Changed pinout based on PCIE_Bonding_Rev G). Updated <a href="#">DC Electrical Characteristics</a> (Added Note 2 and referred the same note in parameter column, added HCSL termination in Condition column for $V_{OL2}$ , $V_{OH2}$ ). Updated <a href="#">AC Electrical Characteristics</a> (updated Note 5, added Note 11 and referred the same note in $T_{DC}$ parameter in Table 16, changed Clod from 2 pF to 4 pF in a Note below, added maximum value of $V_{Xdelta}$ (140 mV) in the Table 16). Updated to new template.
*B	2811340	CXQ	12/03/2009	Changed status from Preliminary to Final. Updated <a href="#">Pin Definitions</a> (Added explanation of 25M output disable feature). Updated <a href="#">Control Registers</a> (Changed default setting (At Power up column) for bit 7 in Table 4 to '1', changed description of bit 5 in Table 4 to 'Global OE bit', added explanation of 25M output disable feature in Table 4, changed unused bits (Type Column) from R/W to R in Table 7, changed default setting (At Power up column) for bit 4 in Table 9 to '1', added explanation of 25M output disable feature in Table 11). Updated the sub-section <a href="#">Crystal Recommendations</a> under the main section <a href="#">Application Information</a> (Added "max" to Load Cap and Eff Series Rest columns in Table 12). Updated sub-section "LVDS Compatible Layout Guidelines" under the main section <a href="#">PCI-Express Layout Guidelines</a> (changed "LVDS Down Device" to "LVDS Device" in all instances). Updated <a href="#">Absolute Maximum Ratings</a> (Changed maximum value of $T_J$ parameter to 125 °C). Updated <a href="#">Recommended Operation Conditions</a> (Added $V_{SMB}$ and $R_{REFTOL}$ parameters and its details). Updated <a href="#">DC Electrical Characteristics</a> (added $R_{REF}$ value to conditions at top, removed $V_{OHSD}$ and $V_{OLSD}$ parameters and their details, changed maximum value of $V_{OH2}$ parameter from 0.85 V to 0.95 V, added $V_{OL3}$ parameter and its details, changed typical value of $I_{OH}$ parameter from -14.2 mA to -15.2 mA, added minimum value of $V_{IL1}$ parameter, changed maximum value of $V_{IL1}$ parameter from 1 V to 0.8 V, changed minimum value of $V_{IH1}$ parameter from 2.2 V to 2.1 V, added typical and maximum values for $I_{DD}$ no load and full load parameters, changed typical value of $I_{DDPD}$ parameter from TBD to 250 $\mu$ A, changed maximum value of $I_{DDPD}$ parameter from TBD to 350 $\mu$ A, added $R_{PU}$ parameter and its details, changed $R_{PD}$ parameter to apply to 25M output only). Updated <a href="#">AC Electrical Characteristics</a> (added $R_{REF}$ value to conditions at top, removed $F_{ERR}$ parameter and its details in Table 15, added $SP_{PROFILE}$ parameter and its details in Table 16, added minimum and maximum values for $SP_{MOD}$ parameter, changed maximum value of $T_{CCJ}$ parameter from 100 ps to 90 ps in Table 16, added $T_{PHJ}$ parameter and its details in Table 16, changed $T_R$ and $T_F$ parameters and its details into $ER_R$ and $ER_F$ parameters in Table 16, removed $T_{RFMATCH}$ parameter and its details in Table 16, splitted $T_{OSKEW}$ parameter into two parameters namely $T_{OSKEW\_ALL}$ and $T_{OSKEW\_P-P}$ parameter and also changed their details in Table 16, added minimum value of $V_{CROSS}$ parameter and also changed the description of the same parameter in Table 16, changed description of $V_{Xdelta}$ parameter in Table 16). Updated <a href="#">Package Diagram</a> (to spec 001-42168 Rev *C). Fixed various typos.
*C	2901711	KVM	05/14/10	Updated <a href="#">Package Diagram</a> .

Document Title: CY24292, Four Outputs PCI-Express Clock Generator Document Number: 001-46142				
Rev.	ECN	Orig. of Change	Submission Date	Description of Change
*D	3448896	PURU	11/28/2011	Updated <a href="#">Features</a> (Removed LVDS related information). Updated <a href="#">Functional Description</a> (Removed LVDS related information). Updated <a href="#">Output Termination</a> under <a href="#">Application Information</a> (Removed LVDS related information). Removed the sub-section "LVDS Compatible Layout Guidelines" under the main section <a href="#">PCI-Express Layout Guidelines</a> . Added <a href="#">Ordering Code Definitions</a> . Added <a href="#">Acronyms</a> and <a href="#">Units of Measure</a> . Updated to new template.
*E	4580588	TAVA	12/05/2014	Updated <a href="#">Functional Description</a> : Added "For a complete list of related documentation, click <a href="#">here</a> ." at the end. Updated <a href="#">Package Diagram</a> .
*F	5281281	PSR	04/26/2017	Added <a href="#">Thermal Resistance</a> . Updated to new template.
*G	5784045	PSR	06/27/2017	Updated <a href="#">AC Electrical Characteristics</a> : Added F <sub>IN</sub> and T <sub>INDC</sub> parameters. Updated <a href="#">Figure 6</a> in <a href="#">Package Diagram</a> (spec 001-42168 *E to *F).

## Sales, Solutions, and Legal Information

### Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
