

### General Description

The XR79120 is a 20A synchronous step-down Power Module for point-of-load supplies. A wide 4.5V to 22V input voltage range allows for single supply operation from industry standard 5V, 12V, and 19.6V rails.

With a proprietary emulated current mode Constant On-Time (COT) control scheme, the XR79120 provides extremely fast line and load transient response using ceramic output capacitors. It requires no loop compensation, hence simplifying circuit implementation and reducing overall component count. The control loop also provides 0.12% load and 0.17% line regulation and maintains constant operating frequency. A selectable power saving mode allows the user to operate in discontinuous mode (DCM) at light current loads, thereby significantly increasing the converter efficiency. With a 93% peak efficiency and 84% for loads as low as 100mA, the XR79120 is suitable for applications where low power losses are important.

A host of protection features, including over-current, over-temperature, short-circuit and UVLO, help achieve safe operation under abnormal operating conditions.

The XR79120 is available in a RoHS compliant, green / halogen free space-saving 74-pin 12 x 14 x 4mm QFN package. With integrated controller, drivers, bootstrap diode and capacitor, MOSFETs, inductor, CIN and COUT, this solution allows the smallest possible 20A POL design.

### FEATURES

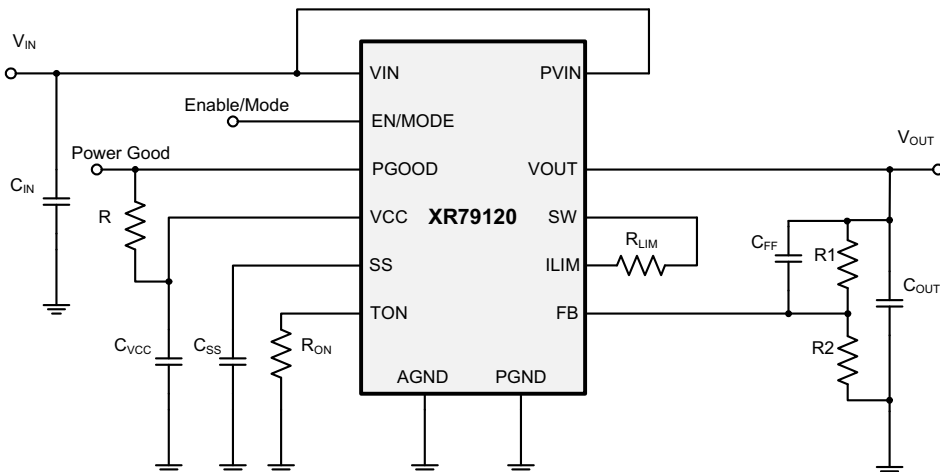

- Controller, drivers, bootstrap diode and capacitor, MOSFETs, Inductor, CIN and COUT integrated in one package
- 20A step down module
  - Wide 4.5V to 22V input voltage range
  - $\geq 0.6V$  adjustable output voltage
- Proprietary Constant On-Time control
  - No loop compensation required
    - Stable ceramic output capacitor operation
  - Programmable 200ns to 2 $\mu$ s on-time
  - Constant 400kHz to 600kHz frequency
- Selectable CCM or CCM / DCM
  - CCM / DCM for high efficiency at light-load
  - CCM for constant frequency at light-load
- Programmable hiccup current limit with thermal compensation
- Precision enable and Power Good flag
- Programmable soft-start
- 74-pin 12x14x4mm QFN package

### APPLICATIONS

- Networking and communications
- Fast transient Point-of-Loads
- Industrial and medical equipment
- Embedded high power FPGA

### Typical Application

Line Regulation

### Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

PV<sub>IN</sub>, V<sub>IN</sub>.....-0.3V to 25V  
 V<sub>CC</sub>.....-0.3V to 6.0V  
 BST.....-0.3V to 31V<sup>(1)</sup>  
 BST-SW.....-0.3V to 6V  
 SW, ILIM.....-1V to 25V<sup>(1, 2)</sup>  
 ALL other pins.....-0.3V to V<sub>CC</sub> + 0.3V  
 Storage temperature.....-65°C to +150°C  
 Junction temperature.....150°C  
 Power dissipation.....Internally Limited  
 Lead temperature (Soldering, 10 sec).....260°C MSL3  
 ESD Rating (HBM - Human Body Model).....2kV

### Operating Conditions

PV<sub>IN</sub>.....3V to 22V  
 V<sub>IN</sub>.....4.5V to 22V  
 V<sub>CC</sub>.....4.5V to 5.5V  
 SW, ILIM.....-1V to 22V<sup>(1)</sup>  
 PGOOD, V<sub>CC</sub>, T<sub>ON</sub>, SS, EN, FB.....-0.3V to 5.5V  
 Switching frequency.....400kHz to 600kHz<sup>(3)</sup>  
 Junction temperature range.....-40°C to +125°C  
 JEDEC51 package thermal resistance, θ<sub>JA</sub>.....14.5°C/W  
 Package power dissipation at 25°C.....6.9W

Note 1: No external voltage applied.

Note 2: The SW pin's minimum DC range is -1V, transient is -5V for less than 50ns.

Note 3: Recommended frequency for optimum performance

### Electrical Characteristics

Unless otherwise noted: T<sub>J</sub> = 25°C, V<sub>IN</sub> = 12V, BST = V<sub>CC</sub>, SW = AGND = PGND = 0V, C<sub>VCC</sub> = 4.7µF. Limits applying over the full operating temperature range are denoted by a “•”

## Pin Assignments

Pin No.	Pin Name	Type	Description
1	PGOOD	OD, O	Power-good output. This open-drain output is pulled low when $V_{OUT}$ is outside the regulation.
2	FB	A	Feedback input to feedback comparator. Connect with a set of resistors to $V_{OUT}$ and AGND in order to program $V_{OUT}$ .
3, 71, 72, AGND PAD	AGND	A	Analog ground. Control circuitry of the IC is referenced to this pin. It should be connected to PVIN at a single point.
4	VIN	PWR	Controller supply input. Provides power to internal LDO. Connect to PVIN.
5	VCC	PWR	The output of the LDO. Bypass with a $4.7\mu\text{F}$ capacitor to AGND. For operation from a $5V_{IN}$ rail, VCC should be tied to VIN.
6, 7, GL PAD	GL	O	Driver output for low-side N-channel synchronous MOSFET. It is internally connected to the gate of the MOSFET. Leave these pins floating.
8	PGND	PWR	Controller low-side driver ground. Connect with a short trace to the closest PGND pins or PGND pad.
13-26, 57, 58, PGND PADS	PGND	PWR	Ground of the power stage. Should be connected to the system's power ground plane.
9-12, 27-32, SW PAD	SW	PWR	Switching node. It is internally connected. Use thermal vias and / or sufficient PCB land area in order to heatsink the low-side FET and the inductor.
33-56, VOUT PADS	VOUT	PWR	Output of the power stage. Place the output filter capacitors as close as possible to these pins.
59-66, PVIN PAD	PVIN	PWR	Power stage input voltage. Place the input filter capacitors as close as possible to these pins.
67, 68, BST PAD	BST	A	Controller high-side driver supply pin. It is internally connected to SW via a $0.1\mu\text{F}$ bootstrap capacitor. Leave these pins floating.
69	ILIM	A	Over-current protection programming. Connect with a short trace to the SW pins.
70	EN/MODE	I	Precision enable pin. Pulling this pin above 1.9V will turn the IC on and it will operate in Forced CCM. If the voltage is raised above 3.0V, then the IC will operate in DCM or CCM, depending on load.
73	TON	A	Constant on-time programming pin. Connect with a resistor to AGND.
74	SS	A	Soft-start pin. Connect an external capacitor between SS and AGND to program the soft-start rate based on the $10\mu\text{A}$ internal source current.

Type: A = Analog, I = Input, O = Output, I/O = Input/Output, PWR = Power, OD = Open-Drain

## Functional Block Diagram

### Typical Performance Characteristics

## Functional Description

XR79120 is a synchronous step-down, proprietary emulated current-mode Constant On-Time (COT) module. The on-time, which is programmed via  $R_{ON}$ , is inversely proportional to  $V_{IN}$  and maintains a nearly constant frequency. The emulated current-mode control is stable with ceramic output capacitors.

Each switching cycle begins with the GH signal turning on the high-side (switching) FET for a preprogrammed time. At the end of the on-time, the high-side FET is turned off and the low-side (synchronous) FET is turned on for a preset minimum time (250ns nominal). This parameter is termed Minimum Off-Time. After the Minimum Off-Time, the voltage at the feedback pin FB is compared to an internal voltage ramp at the feedback comparator. When  $V_{FB}$  drops below the ramp voltage, the high-side FET is turned on and the cycle repeats. This voltage ramp constitutes an emulated current ramp and makes possible the use of ceramic capacitors, in addition to other capacitor types, for output filtering.

### Enable / Mode Input (EN/MODE)

The EN/MODE pin accepts a tri-level signal that is used to control turn on and turn off. It also selects between two modes of operation: 'Forced CCM' and 'DCM / CCM'. If EN/MODE is pulled below 1.8V, the module shuts down. A voltage between 2.0V and 2.8V selects the Forced CCM Mode, which will run the module in continuous conduction at all times. A voltage higher than 3.1V selects the DCM / CCM mode, which will run the module in discontinuous conduction at light loads.

### Selecting the Forced CCM Mode

In order to set the module to operate in Forced CCM, a voltage between 2.0V and 2.8V must be applied to EN/MODE. This can be achieved with an external control signal that meets the above voltage requirement. Where an external control is not available, the EN/MODE can be derived from  $V_{IN}$ . If  $V_{IN}$  is well regulated, use a resistor divider and set the voltage to 2.5V. If  $V_{IN}$  varies over a wide range, the circuit shown in Figure 25 can be used to generate the required voltage. Note that at  $V_{IN}$  of 5V and 22V, the nominal Zener voltage is 3.8V and 4.7V, respectively. Therefore for  $V_{IN}$  in the range of 4.5V to 22V, the circuit shown in Figure 25 will generate the  $V_{EN}$  required for Forced CCM.

### Selecting the DCM / CCM Mode

In order to set the module operation to DCM / CCM, a voltage between 3.1V and 5.5V must be applied to the EN/MODE pin. If an external control signal is available, it can be directly connected to EN/MODE. In applications

where an external control is not available, the EN/MODE input can be derived from  $V_{IN}$ . If  $V_{IN}$  is well regulated, use a resistor divider and set the voltage to 4V. If  $V_{IN}$  varies over a wide range, the circuit shown in Figure 26 can be used to generate the required voltage.

Figure 25: Selecting Forced CCM by deriving EN/MODE from  $V_{IN}$

Figure 26: Selecting DCM/CCM by deriving EN/MODE from  $V_{IN}$

### Programming the On-Time

The on-time  $T_{ON}$  is programmed via resistor  $R_{ON}$  according to following equation:

$$R_{ON} = \frac{V_{IN} \times [T_{ON} - (30 \times 10^{-9})]}{3.1 \times 10^{-10}}$$

where  $T_{ON}$  is calculated from:

$$T_{ON} = \frac{V_{OUT}}{V_{IN} \times f \times Eff}$$

Where:

$f$  is the desired switching frequency at nominal  $I_{OUT}$

$Eff$  is the module efficiency corresponding to nominal  $I_{OUT}$  shown in Figures 19, 21, and 23

Substituting for  $T_{ON}$  in the first equation we get:

$$R_{ON} = \frac{\left(\frac{V_{OUT}}{f \times Eff}\right) - [(25 \times 10^{-9}) \times V_{IN}]}{2.85 \times 10^{-10}}$$

### Over-Current Protection (OCP)

If load current exceeds the programmed over-current  $I_{OCP}$  for four consecutive switching cycles, then the module enters the hiccup mode of operation. In hiccup mode, the MOSFET gates are turned off for 110ms (hiccup timeout). Following the hiccup timeout, a soft-start is attempted. If OCP persists, hiccup timeout will repeat. The module will remain in hiccup mode until load current is reduced below the programmed  $I_{OCP}$ . In order to program the over-current protection, use the following equation:

$$RLIM = \frac{(I_{OCP} \times R_{DS}) + 8mV}{ILIM}$$

Where:

$RLIM$  is resistor value for programming  $I_{OCP}$

$I_{OCP}$  is the over-current threshold to be programmed

$R_{DS}$  is the MOSFET rated on resistance (3.3m $\Omega$ )

8mV is the OCP comparator maximum offset

$ILIM$  is the internal current that generates the necessary OCP comparator threshold (use 45 $\mu$ A).

Note that  $ILIM$  has a positive temperature coefficient of 0.4%/°C (Figure 9). This is meant to roughly match and compensate for the positive temperature coefficient of the synchronous FET. A graph of typical  $I_{OCP}$  versus  $RLIM$  is shown in Figure 7.

### Short-Circuit Protection (SCP)

If the output voltage drops below 60% of its programmed value, the module will enter hiccup mode. Hiccup will persist until the short-circuit is removed. The SCP circuit becomes active after PGOOD asserts high.

### Over-Temperature (OTP)

OTP triggers at a nominal die temperature of 150°C. The gates of the switching FET and synchronous FET are turned off. When die temperature cools down to 135°C, soft-start is initiated and operation resumes.

### Programming the Output Voltage

Use an external voltage divider as shown in the Application Circuit to program the output voltage  $V_{OUT}$ .

$$R1 = R2 \times \left(\frac{V_{OUT}}{0.6} - 1\right)$$

where  $R2$  has a nominal value of 2k $\Omega$ .

### Programming the Soft-start

Place a capacitor  $CSS$  between the SS and AGND pins to program the soft-start. In order to program a soft-start time of TSS, calculate the required capacitance  $CSS$  from the following equation:

$$CSS = TSS \times \left(\frac{10\mu A}{0.6V}\right)$$

### Feed-Forward Capacitor (C<sub>FF</sub>)

A feed-forward capacitor (C<sub>FF</sub>) may be necessary depending on the Equivalent Series Resistance (ESR) of C<sub>OUT</sub>. If only ceramic output capacitors are used for C<sub>OUT</sub>, then a C<sub>FF</sub> is necessary. Calculate C<sub>FF</sub> from:

$$C_{FF} = \frac{1}{2 \times \pi \times R1 \times 7 \times f_{LC}}$$

Where:

R1 is the resistor that C<sub>FF</sub> is placed in parallel with

f<sub>LC</sub> is the frequency of output filter double-pole

f<sub>LC</sub> must be less than 13kHz when using ceramic C<sub>OUT</sub>. If necessary, increase C<sub>OUT</sub> in order to meet this constraint.

When using capacitors with higher ESR, such as the PANASONIC TPE series, a C<sub>FF</sub> is not required provided following conditions are met:

1. The frequency of output filter LC double-pole f<sub>LC</sub> should be less than 10kHz.
2. The frequency of ESR Zero f<sub>Zero,ESR</sub> should be at least three times larger than f<sub>LC</sub>.

Note that if f<sub>Zero,ESR</sub> is less than 5xf<sub>LC</sub>, then it is recommended to set the f<sub>LC</sub> at less than 2kHz. C<sub>FF</sub> is still not required.

### Maximum Allowable Voltage Ripple at FB Pin

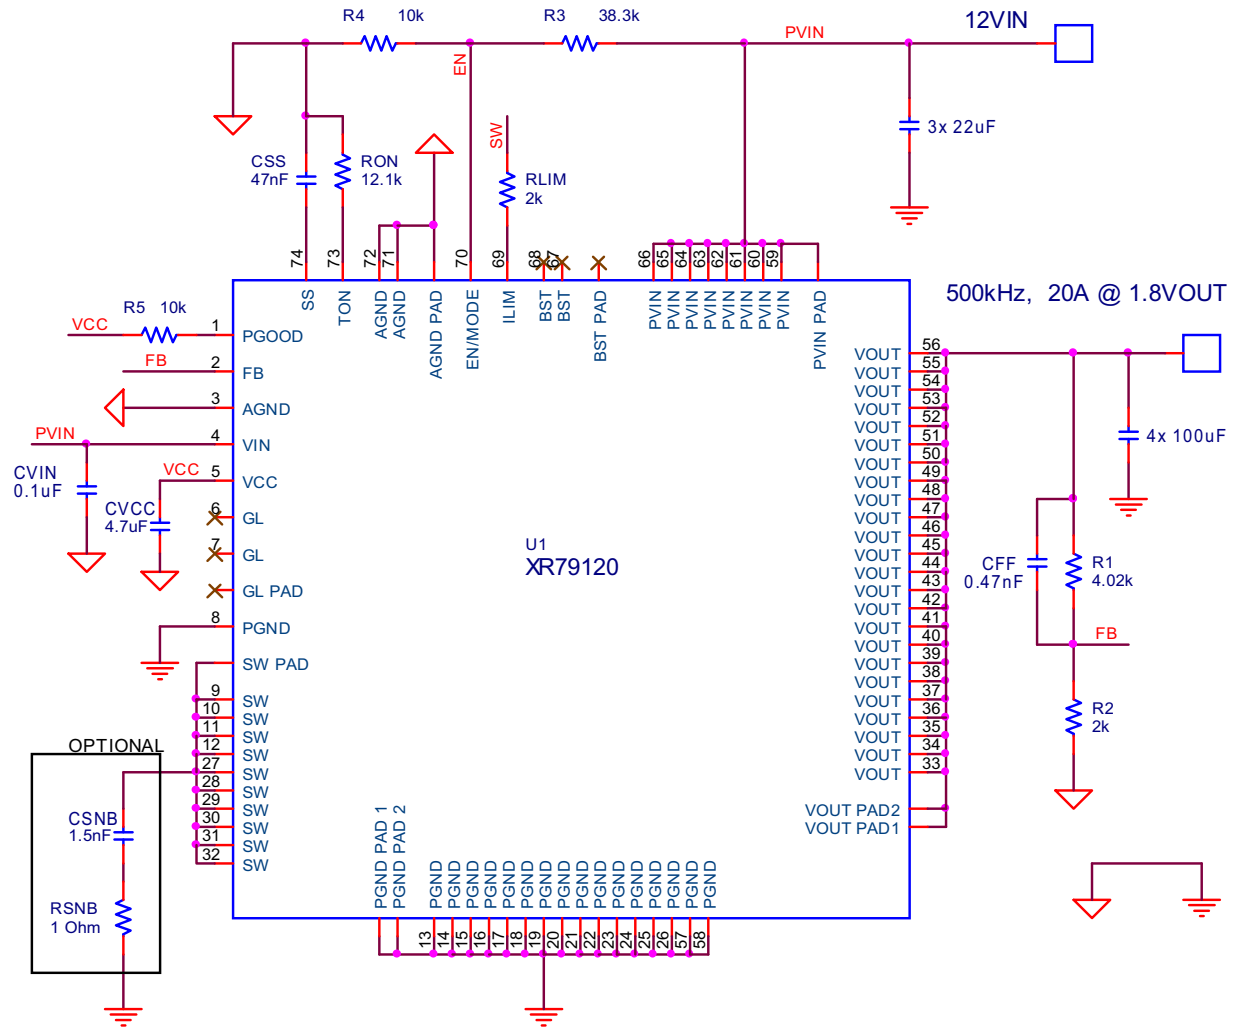

Note that the steady-state voltage ripple at feedback pin FB (V<sub>FB,RIPPLE</sub>) must not exceed 50mV in order for the module to function correctly. If V<sub>FB,RIPPLE</sub> is larger than 50mV, the C<sub>OUT</sub> should be increased as necessary in order to keep the V<sub>FB,RIPPLE</sub> below 50mV.

Poor PCB layout can cause FET switching noise at the output and may couple to the FB pin via C<sub>FF</sub>. Excessive noise at FB will cause poor load regulation. To solve this problem, place a resistor R<sub>FF</sub> in series with C<sub>FF</sub>. An R<sub>FF</sub> value up to 2% of R1 is acceptable.

### Maximum Recommended V<sub>OUT</sub> versus Frequency

V<sub>OUT</sub> versus frequency curves corresponding to inductor current ripple ΔIL of 10A, 8A and 6A are plotted in Figure 12. These curves show the relationship between V<sub>OUT</sub>, f and ΔIL for V<sub>IN</sub> = 12V. As an example, for operating conditions of V<sub>IN</sub> = 12V, V<sub>OUT</sub> = 1.5V and f = 500kHz, the current ripple is about 6.5A. Note that maximum recommended peak-to-peak ΔIL is 10A. Therefore the maximum permissible V<sub>OUT</sub> versus f corresponds to the top curve in Figure 12. For example, with V<sub>IN</sub> = 12V and f = 500kHz maximum, V<sub>OUT</sub> is 2.5V.
