**16M-BIT [x 1/x 2/x 4] CMOS SERIAL FLASH****FEATURES****GENERAL**

- Serial Peripheral Interface compatible -- Mode 0 and Mode 3
- 16,777,216 x 1 bit structure or 8,388,608 x 2 bits structure or 4,194,304 x 4 bits structure
- 512 Equal Sectors with 4K byte each
  - Any Sector can be erased individually
- 32 Equal Blocks with 64K byte each
  - Any Block can be erased individually
- Single Power Supply Operation
  - 2.7 to 3.6 volt for read, erase, and program operations
- Latch-up protected to 100mA from -1V to Vcc +1V

**PERFORMANCE**

- High Performance
  - Fast read
    - 1 I/O: 133MHz with 8 dummy cycles
    - 2 I/O: 108MHz with 4 dummy cycles for 2READ instruction; 133MHz with 8 dummy cycles for DREAD instruction
    - 4 I/O: 133MHz with 6 dummy cycles
  - Fast program time: 0.7ms(typ.) and 3ms(max.)/page (256-byte per page)
  - Byte program time: 9us (typical)
  - Fast erase time: 60ms (typ.)/sector (4K-byte per sector) ; 0.4s(typ.) /block (64K-byte per block); 6s(typ.) /chip
- Low Power Consumption
  - Low active read current: 35mA(max.) at 133MHz and 10mA(max.) at 50MHz
  - Low active programming current: 20mA (max.)
  - Low active erase current: 20mA (max.)
  - Low standby current: 20uA (typ.); 50uA (max.)
  - Deep power down current: 3uA (typ.); 20uA (max.)
- Typical 100,000 erase/program cycles
- 20 years data retention

**SOFTWARE FEATURES**

- Input Data Format
  - 1-byte Command code
- Advanced Security Features
  - Block lock protection
  - The BP0-BP3 status bit defines the size of the area to be software protection against program and erase instructions
  - Additional 4K-bit secured OTP for unique identifier
- Auto Erase and Auto Program Algorithm
  - Automatically erases and verifies data at selected sector
  - Automatically programs and verifies data at selected page by an internal algorithm that automatically times the program pulse widths (Any page to be programmed should have page in the erased state first).
- Status Register Feature
- Electronic Identification
  - JEDEC 1-byte manufacturer ID and 2-byte device ID
  - RES command for 1-byte Device ID
  - All REMS, REMS2 and REMS4 commands for 1-byte manufacturer ID and 1-byte device ID

**HARDWARE FEATURES**

- SCLK Input
  - Serial clock input
- SI/SIO0
  - Serial Data Input or Serial Data Input/Output for 2 x I/O read mode and 4 x I/O read mode
- SO/SIO1
  - Serial Data Output or Serial Data Input/Output for 2 x I/O read mode and 4 x I/O read mode
- WP#/SIO2
  - Hardware write protection or serial data Input/Output for 4 x I/O read mode
- NC/SIO3
  - NC pin or serial data Input/Output for 4 x I/O read mode
- PACKAGE
  - 8-pin SOP (200mil)
  - **All devices are RoHS Compliant**

## GENERAL DESCRIPTION

The MX25L1636E are 16,777,216 bit serial Flash memory, which is configured as 2,097,152 x 8 internally. When it is in four I/O read mode, the structure becomes 8,388,608 bits x 2 or 4,194,304 bits x 4. The MX25L1636E feature a serial peripheral interface and software protocol allowing operation on a simple 3-wire bus. The three bus signals are a clock input (SCLK), a serial data input (SI), and a serial data output (SO). Serial access to the device is enabled by CS# input.

When it is in two I/O read mode, the SI pin and SO pin become SIO0 pin and SIO1 pin for address/dummy bits input and data output. When it is in four I/O read mode, the SI pin, SO pin, WP# pin and NC pin become SIO0 pin, SIO1 pin, SIO2 pin and SIO3 pin for address/dummy bits input and data output.

The MX25L1636E provides sequential read operation on whole chip.

After program/erase command is issued, auto program/erase algorithms which program/erase and verify the specified page or sector/block locations will be executed. Program command is executed on byte basis, or page (256 bytes) basis, or word basis for Continuously program mode, and erase command is executes on sector (4K-byte), or block (64K-byte), or whole chip basis.

To provide user with ease of interface, a status register is included to indicate the status of the chip. The status read command can be issued to detect completion status of a program or erase operation via WIP bit.

Secured OTP and Block Protection, please see security feature and write status register section for more details.

When the device is not in operation and CS# is high, it is put in standby mode and draws less than 50uA DC current.

**Table 1. Additional Feature Comparison**

Additional Features Part Name	Protection and Security		Read Performance			Identifier				
	Flexible Block Protection (BP0-BP3)	4K-bit secured OTP	1 I/O Read	2 I/O Read	4 I/O Read	RES (command: AB hex)	REMS (command: 90 hex)	REMS2 (command: EF hex)	REMS4 (command: DF hex)	RDID (command: 9F hex)
MX25L1636E	V	V	V	V	V	25 (hex)	C2 25 (hex) (if ADD=0)	C2 25 (hex) (if ADD=0)	C2 25 (hex) (if ADD=0)	C2 25 15 (hex)

### PIN CONFIGURATIONS

#### 8-PIN SOP (200mil)

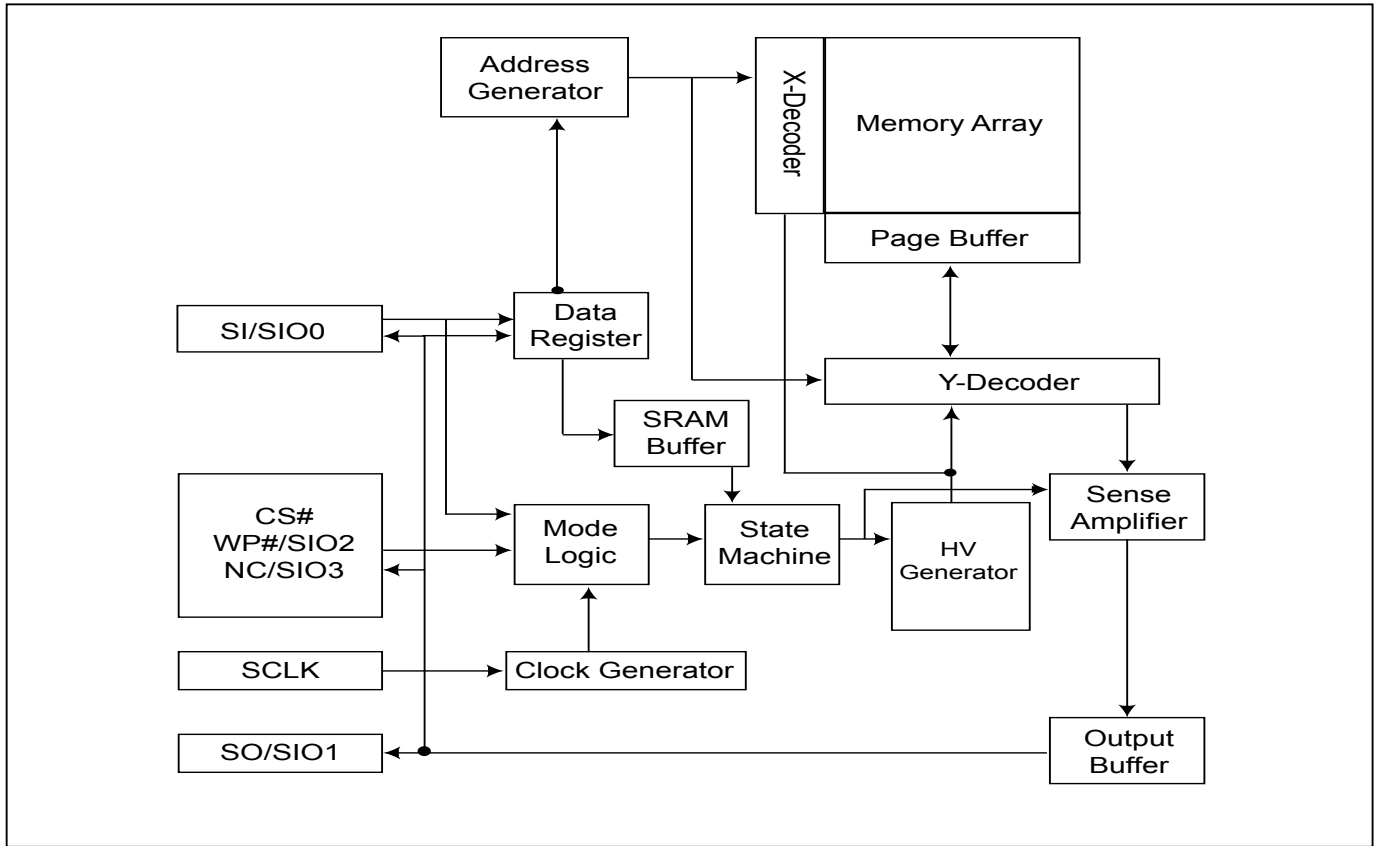

### PIN DESCRIPTION

SYMBOL	DESCRIPTION
CS#	Chip Select
SI/SIO0	Serial Data Input (for 1 x I/O) / Serial Data Input & Output (for 2xI/O or 4xI/O read mode)
SO/SIO1	Serial Data Output (for 1 x I/O) Serial Data Input & Output (for 2xI/O or 4xI/O read mode)
SCLK	Clock Input
WP#/SIO2	Write protection: connect to GND or Serial Data Input & Output (for 4xI/O read mode)
NC/SIO3	NC pin (Not connect) or Serial Data Input & Output (for 4xI/O read mode)
VCC	+ 3.3V Power Supply
GND	Ground

### BLOCK DIAGRAM

## DATA PROTECTION

During power transition, there may be some false system level signals which result in inadvertent erasure or programming. The device is designed to protect itself from these accidental write cycles.

The state machine will be reset as standby mode automatically during power up. In addition, the control register architecture of the device constrains that the memory contents can only be changed after specific command sequences have completed successfully.

In the following, there are several features to protect the system from the accidental write cycles during VCC power-up and power-down or from system noise.

- Valid command length checking: The command length will be checked whether it is at byte base and completed on byte boundary.
- Write Enable (WREN) command: WREN command is required to set the Write Enable Latch bit (WEL) before other command to change data. The WEL bit will return to reset stage under following situation:
  - Power-up
  - Write Disable (WRDI) command completion
  - Write Status Register (WRSR) command completion
  - Page Program (PP) command completion
  - Page Program (4PP) command completion
  - Sector Erase (SE) command completion
  - Block Erase (BE) command completion
  - Chip Erase (CE) command completion
- Deep Power Down Mode: By entering deep power down mode, the flash device also is under protected from writing all commands except Release from deep power down mode command (RDP) and Read Electronic Signature command (RES).
- Advanced Security Features: there are some protection and security features which protect content from inadvertent write and hostile access.

### I. Block lock protection

- The Software Protected Mode (SPM) use (BP3, BP2, BP1, BP0) bits to allow part of memory to be protected as read only. The protected area definition is shown as "[Table 2. Protected Area Sizes](#)", the protected areas are more flexible which may protect various area by setting value of BP0-BP3 bits.

Please refer to "[Table 2. Protected Area Sizes](#)".

- The Hardware Protected Mode (HPM) use WP#/SIO2 to protect the (BP3, BP2, BP1, BP0) bits and SRWD bit. If the system goes into four I/O read mode, the feature of HPM will be disabled.

**Table 2. Protected Area Sizes**

Status bit				Protect Level	
BP3	BP2	BP1	BP0	No.	16Mb
0	0	0	0	0	(none)
0	0	0	1	1	(1block, protected block 31th)
0	0	1	0	2	(2blocks, protected block 30th-31th)
0	0	1	1	3	(4blocks, protected block 28th-31th)
0	1	0	0	4	(8blocks, protected block 24th-31th)
0	1	0	1	5	(16blocks, protected block 16th-31th)
0	1	1	0	6	(32blocks, protected all)
0	1	1	1	7	(32blocks, protected all)
1	0	0	0	8	(32blocks, protected all)
1	0	0	1	9	(32blocks, protected all)
1	0	1	0	10	(16blocks, protected block 0th-15th)
1	0	1	1	11	(24blocks, protected block 0th-23th)
1	1	0	0	12	(28blocks, protected block 0th-27th)
1	1	0	1	13	(30blocks, protected block 0th-29th)
1	1	1	0	14	(31blocks, protected block 0th-30th)
1	1	1	1	15	(32blocks, protected all)

**II. Additional 4K-bit secured OTP** for unique identifier: to provide 4K-bit One-Time Program area for setting device unique serial number - Which may be set by factory or system maker. Please refer to ["Table 3. 4K-bit Secured OTP Definition"](#).

- Security register bit 0 indicates whether the chip is locked by factory or not.
- To program the 4K-bit secured OTP by entering 4K-bit secured OTP mode (with ENSO command), and going through normal program procedure, and then exiting 4K-bit secured OTP mode by writing EXSO command.
- Customer may lock-down the customer lockable secured OTP by writing WRSCUR(write security register) command to set customer lock-down bit1 as "1". Please refer to table of "Security Register Definition" for security register bit definition and ["Table 3. 4K-bit Secured OTP Definition"](#) for address range definition.
- Note: Once lock-down whatever by factory or customer, it cannot be changed any more. While in 4K-bit Secured OTP mode, array access is not allowed.

**Table 3. 4K-bit Secured OTP Definition**

Address range	Size	Standard Factory Lock	Customer Lock
xxx000~xxx00F	128-bit	ESN (electrical serial number)	Determined by customer
xxx010~xxx1FF	3968-bit	N/A

## DEVICE OPERATION

1. Before a command is issued, status register should be checked to ensure device is ready for the intended operation.
2. When incorrect command is inputted to this LSI, this LSI becomes standby mode and keeps the standby mode until next CS# falling edge. In standby mode, all SO pins of this LSI should be High-Z.
3. When correct command is inputted to this LSI, this LSI becomes active mode and keeps the active mode until next CS# rising edge.
4. Input data is latched on the rising edge of Serial Clock (SCLK) and data shifts out on the falling edge of SCLK. The difference of Serial mode 0 and mode 3 is shown as "Figure 1. Serial Modes Supported".
5. For the following instructions: RDID, RDSR, RDSCUR, READ, FAST\_READ, 2READ, 4READ, RES, REMS, REMS2 and REMS4 the shifted-in instruction sequence is followed by a data-out sequence. After any bit of data being shifted out, the CS# can be high. For the following instructions: WREN, WRDI, WRSR, SE, BE, CE, PP, 4PP, CP, RDP, DP, ENSO, EXSO, and WRSCUR, the CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.
6. During the progress of Write Status Register, Program, Erase operation, to access the memory array is neglected and not affect the current operation of Write Status Register, Program, Erase.

**Figure 1. Serial Modes Supported**

**Note:**

CPOL indicates clock polarity of Serial master, CPOL=1 for SCLK high while idle, CPOL=0 for SCLK low while not transmitting. CPHA indicates clock phase. The combination of CPOL bit and CPHA bit decides which Serial mode is supported.

**COMMAND DESCRIPTION**

**Table 5. Command Set**

COMMAND (byte)	WREN (write enable)	WRDI (write disable)	RDID (read identification)	RDSR (read status register)	WRSR (write status register)	READ (read data)	FAST READ (fast read data)	DREAD (11 2O read command)	2READ (2 x I/O read command) Note1
1st byte	06 (hex)	04 (hex)	9F (hex)	05 (hex)	01 (hex)	03 (hex)	0B (hex)	3B (hex)	BB (hex)
2nd byte					Values	AD1 (A23-A16)	AD1	AD1	ADD(2)
3rd byte						AD2 (A15-A8)	AD2	AD2	ADD(2) & Dummy (2)
4th byte						AD3 (A7-A0)	AD3	AD3	
5th byte							Dummy	Dummy	
Action	sets the (WEL) write enable latch bit	resets the (WEL) write enable latch bit	outputs JEDEC ID: 1-byte manufacturer ID & 2-byte device ID	to read out the values of the status register	to write new values to the status register	n bytes read out until CS# goes high	n bytes read out until CS# goes high	n bytes read out by Dual output until CS# goes high	n bytes read out by 2xI/O until CS# goes high

COMMAND (byte)	4READ (4 x I/O read command)	4PP (quad page program)	SE (sector erase)	BE (block erase)	CE (chip erase)	PP (Page program)	DP (Deep power down)	RDP (Release from deep power down)	RES (read electronic ID)
1st byte	EB (hex)	38 (hex)	20 (hex)	D8 (hex)	60 or C7 (hex)	02 (hex)	B9 (hex)	AB (hex)	AB (hex)
2nd byte	ADD(4) & Dummy (4)	AD1	AD1	AD1		AD1			x
3rd byte	Dummy (4)		AD2	AD2		AD2			x
4th byte			AD3	AD3		AD3			x
Action	n bytes read out by 4 x I/O until CS# goes high	quad input to program the selected page	to erase the selected sector	to erase the selected block	to erase whole chip	to program the selected page	enters deep power down mode	release from deep power down mode	to read out 1-byte device ID

COMMAND (byte)	REMS (read electronic manufacturer & device ID)	REMS2 (read ID for 2x I/O mode)	REMS4 (read ID for 4x I/O mode)	ENSO (enter secured OTP)	EXSO (exit secured OTP)	RDSCUR (read security register)	WRSCUR (write security register)	Release Read Enhanced
1st byte	90 (hex)	EF (hex)	DF (hex)	B1 (hex)	C1 (hex)	2B (hex)	2F (hex)	FFh (hex)
2nd byte	x	x	x					x
3rd byte	x	x	x					x
4th byte	ADD (Note 2)	ADD (Note 2)	ADD (Note 2)					x
Action	output the manufacturer ID & device ID	output the manufacturer ID & device ID	output the manufacturer ID & device ID	to enter the 4K-bit secured OTP mode	to exit the 4K-bit secured OTP mode	to read value of security register	to set the lock-down bit as "1" (once lock-down, cannot be updated)	All these commands FFh,00h,AAh or 55h will escape the performance enhance mode

Note 1: The count base is 4-bit for ADD(2) and Dummy(2) because of 2 x I/O. And the MSB is on SI/SIO1 which is different from 1 x I/O condition.

Note 2: ADD=00H will output the manufacturer ID first and ADD=01H will output device ID first.

Note 3: It is not recommended to adopt any other code not in the command definition table, which will potentially enter the hidden mode.

**(1) Write Enable (WREN)**

The Write Enable (WREN) instruction is for setting Write Enable Latch (WEL) bit. For those instructions like PP, 4PP, CP, SE, BE, CE, and WRSR, which are intended to change the device content, should be set every time after the WREN instruction setting the WEL bit.

The sequence of issuing WREN instruction is: CS# goes low→ sending WREN instruction code→ CS# goes high. (Please refer to "[Figure 9. Write Enable \(WREN\) Sequence \(Command 06\)](#)")

**(2) Write Disable (WRDI)**

The Write Disable (WRDI) instruction is for resetting Write Enable Latch (WEL) bit.

The sequence of issuing WRDI instruction is: CS# goes low→ sending WRDI instruction code→ CS# goes high. (Please refer to "[Figure 10. Write Disable \(WRDI\) Sequence \(Command 04\)](#)")

The WEL bit is reset by following situations:

- Power-up
- Write Disable (WRDI) instruction completion
- Write Status Register (WRSR) instruction completion
- Page Program (PP) instruction completion
- Quad Page Program (4PP) instruction completion
- Sector Erase (SE) instruction completion
- Block Erase (BE) instruction completion
- Chip Erase (CE) instruction completion

**(3) Read Identification (RDID)**

The RDID instruction is for reading the manufacturer ID of 1-byte and followed by Device ID of 2-byte. The Macronix Manufacturer ID is C2(hex), the memory type ID is 25(hex) as the first-byte device ID, and the individual device ID of second-byte ID are listed as "[Table 7. ID Definitions](#)".

The sequence of issuing RDID instruction is: CS# goes low→ sending RDID instruction code→ 24-bits ID data out on SO→ to end RDID operation can use CS# to high at any time during data out. (Please refer to "[Figure 11. Read Identification \(RDID\) Sequence \(Command 9F\)](#)".)

While Program/Erase operation is in progress, it will not decode the RDID instruction, so there's no effect on the cycle of program/erase operation which is currently in progress. When CS# goes high, the device is at standby stage.

#### (4) Read Status Register (RDSR)

The RDSR instruction is for reading Status Register Bits. The Read Status Register can be read at any time (even in program/erase/write status register condition) and continuously. It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.

The sequence of issuing RDSR instruction is: CS# goes low→ sending RDSR instruction code→ Status Register data out on SO (Please refer to "[Figure 12. Read Status Register \(RDSR\) Sequence \(Command 05\)](#)")

The definition of the status register bits is as below:

**WIP bit.** The Write in Progress (WIP) bit, a volatile bit, indicates whether the device is busy in program/erase/write status register progress. When WIP bit sets to 1, which means the device is busy in program/erase/write status register progress. When WIP bit sets to 0, which means the device is not in progress of program/erase/write status register cycle.

**WEL bit.** The Write Enable Latch (WEL) bit, a volatile bit, indicates whether the device is set to internal write enable latch. When WEL bit sets to 1, which means the internal write enable latch is set, the device can accept program/erase/write status register instruction. When WEL bit sets to 0, which means no internal write enable latch; the device will not accept program/erase/write status register instruction. The program/erase command will be ignored and not affect value of WEL bit if it is applied to a protected memory area.

**BP3, BP2, BP1, BP0 bits.** The Block Protect (BP3, BP2, BP1, BP0) bits, non-volatile bits, indicate the protected area (as defined in table 2) of the device to against the program/erase instruction without hardware protection mode being set. To write the Block Protect (BP3, BP2, BP1, BP0) bits requires the Write Status Register (WRSR) instruction to be executed. Those bits define the protected area of the memory to against Page Program (PP), Sector Erase (SE), Block Erase (BE) and Chip Erase (CE) instructions (only if all Block Protect bits set to 0, the CE instruction can be executed).

**QE bit.** The Quad Enable (QE) bit, non-volatile bit, performs Quad when it is reset to "0" (factory default) to enable WP# or is set to "1" to enable Quad SIO2 and SIO3. Once the system goes into Quad I/O mode, the feature of HPM will be disabled.

**SRWD bit.** The Status Register Write Disable (SRWD) bit, non-volatile bit, which is set to "0" (factory default). The SRWD bit is operated together with Write Protection (WP#/SIO2) pin for providing hardware protection mode. The hardware protection mode requires SRWD sets to 1 and WP#/SIO2 pin signal is low stage. In the hardware protection mode, the Write Status Register (WRSR) instruction is no longer accepted for execution and the SRWD bit and Block Protect bits (BP3, BP2, BP1, BP0) are read only.

#### Status Register

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
SRWD (status register write protect)	QE (Quad Enable)	BP3 (level of protected block)	BP2 (level of protected block)	BP1 (level of protected block)	BP0 (level of protected block)	WEL (write enable latch)	WIP (write in progress bit)
1=status register write disable	1=Quad Enable 0=not Quad Enable	(note 1)	(note 1)	(note 1)	(note 1)	1=write enable 0=not write enable	1=write operation 0=not in write operation
Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	Non-volatile bit	volatile bit	volatile bit
Factory default=0	Factory default=0	Factory default=0	Factory default=0	Factory default=0	Factory default=0	Factory default=0	Factory default=0

Note 1: see the "[Table 2. Protected Area Sizes](#)".

**(5) Write Status Register (WRSR)**

The WRSR instruction is for changing the values of Status Register Bits. Before sending WRSR instruction, the Write Enable (WREN) instruction must be decoded and executed to set the Write Enable Latch (WEL) bit in advance. The WRSR instruction can change the value of Block Protect (BP3, BP2, BP1, BP0) bits to define the protected area of memory (as shown in "Table 2. Protected Area Sizes"). The WRSR also can set or reset the Quad enable (QE) bit and set or reset the Status Register Write Disable (SRWD) bit in accordance with Write Protection (WP#/SIO2) pin signal, but has no effect on bit1(WEL) and bit0 (WIP) of the status register. The WRSR instruction cannot be executed once the Hardware Protected Mode (HPM) is entered.

The sequence of issuing WRSR instruction is: CS# goes low→ sending WRSR instruction code→ Status Register data on SI→ CS# goes high. (Please refer to "Figure 13. Write Status Register (WRSR) Sequence (Command 01)")

The CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be check out during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

**Table 6. Protection Modes**

Mode	Status register condition	WP# and SRWD bit status	Memory
Software protection mode (SPM)	Status register can be written in (WEL bit is set to "1") and the SRWD, BP0-BP1 bits can be changed	WP#=1 and SRWD bit=0, or WP#=0 and SRWD bit=0, WP#=1 and SRWD bit=1	The protected area cannot be programmed or erased.
Hardware protection mode (HPM)	The SRWD, BP0-BP1 of status register bits can be changed	WP#=0, SRWD bit=1	The protected area cannot be programmed or erased.

Note:

1. As defined by the values in the Block Protect (BP3, BP2, BP1, BP0) bits of the Status Register.

As the above table showing, the summary of the Software Protected Mode (SPM) and Hardware Protected Mode (HPM).

Software Protected Mode (SPM):

- When SRWD bit=0, no matter WP#/SIO2 is low or high, the WREN instruction may set the WEL bit and can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM).
- When SRWD bit=1 and WP#/SIO2 is high, the WREN instruction may set the WEL bit can change the values of SRWD, BP3, BP2, BP1, BP0. The protected area, which is defined by BP3, BP2, BP1, BP0, is at software protected mode (SPM)

Note:

If SRWD bit=1 but WP#/SIO2 is low, it is impossible to write the Status Register even if the WEL bit has previously been set. It is rejected to write the Status Register and not be executed.

Hardware Protected Mode (HPM):

- When SRWD bit=1, and then WP#/SIO2 is low (or WP#/SIO2 is low before SRWD bit=1), it enters the hardware protected mode (HPM). The data of the protected area is protected by software protected mode by BP3, BP2, BP1, BP0 and hardware protected mode by the WP#/SIO2 to against data modification.

Note:

To exit the hardware protected mode requires WP#/SIO2 driving high once the hardware protected mode is entered. If the WP#/SIO2 pin is permanently connected to high, the hardware protected mode can never be entered; only can use software protected mode via BP3, BP2, BP1, BP0.

If the system goes into four I/O read mode, the feature of HPM will be disabled.

### (6) Read Data Bytes (READ)

The read instruction is for reading data out. The address is latched on rising edge of SCLK, and data shifts out on the falling edge of SCLK at a maximum frequency  $f_R$ . The first address can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing READ instruction is: CS# goes low→ sending READ instruction code→ 3-byte address on SI→ data out on SO→ to end READ operation can use CS# to high at any time during data out. (Please refer to "[Figure 14. Read Data Bytes \(READ\) Sequence \(Command 03\)](#)")

### (7) Read Data Bytes at Higher Speed (FAST\_READ)

The FAST\_READ instruction is for quickly reading data out. The address is latched on rising edge of SCLK, and data of each bit shifts out on the falling edge of SCLK at a maximum frequency  $f_C$ . The first address can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single FAST\_READ instruction. The address counter rolls over to 0 when the highest address has been reached.

The sequence of issuing FAST\_READ instruction is: CS# goes low→ sending FAST\_READ instruction code→3-byte address on SI→ 1-dummy byte address on SI→data out on SO→to end FAST\_READ operation can use CS# to high at any time during data out. (Please refer to "[Figure 15. Read at Higher Speed \(FAST\\_READ\) Sequence \(Command 0B\)](#)")

While Program/Erase/Write Status Register cycle is in progress, FAST\_READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

### (8) Dual Output Read Mode (DREAD)

The DREAD instruction enable double throughput of Serial Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency  $f_T$ . The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single DREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing DREAD instruction, the following data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing DREAD instruction is: CS# goes low→ sending DREAD instruction→3-byte address on SIO0→ 8-bit dummy cycle on SIO0→ data out interleave on SIO1 & SIO0→ to end DREAD operation can use CS# to high at any time during data out (Please refer to "[Figure 16. Dual Read Mode Sequence \(Command 3B\)](#)").

While Program/Erase/Write Status Register cycle is in progress, DREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

### **(9) 2 x I/O Read Mode (2READ)**

The 2READ instruction enable double throughput of Serial Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fT. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 2READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 2READ instruction, the following address/dummy/data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing 2READ instruction is: CS# goes low→ sending 2READ instruction→ 24-bit address interleave on SIO1 & SIO0→ 4-bit dummy cycle on SIO1 & SIO0→data out interleave on SIO1 & SIO0→to end 2READ operation can use CS# to high at any time during data out (Please refer to "[Figure 17. 2 x I/O Read Mode Sequence \(Command BB\)](#)").

While Program/Erase/Write Status Register cycle is in progress, 2READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

### **(10) 4 x I/O Read Mode (4READ)**

The 4READ instruction enable quad throughput of Serial Flash in read mode. A Quad Enable (QE) bit of status Register must be set to "1" before sending the 4READ instruction. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 4READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 4READ instruction, the following address/dummy/data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing 4READ instruction is: CS# goes low→ sending 4READ instruction→ 24-bit address interleave on SIO3, SIO2, SIO1 & SIO0→ 6 dummy cycles → data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end 4READ operation can use CS# to high at any time during data out (Please refer to "[Figure 18. 4 x I/O Read Mode Sequence \(Command EB\)](#)").

Another sequence of issuing 4READ instruction especially useful in random access is : CS# goes low→ sending 4 READ instruction→ 3-bytes address interleave on SIO3, SIO2, SIO1 & SIO0 → performance enhance toggling bit P[7:0]→ 4 dummy cycles → data out still CS# goes high → CS# goes low (reduce 4 Read instruction) → 24-bit random access address (Please refer to "[Figure 19. 4 x I/O Read enhance performance Mode Sequence \(Command EB\)](#)").

In the performance-enhancing mode (Note of Figure. 19), P[7:4] must be toggling with P[3:0] ; likewise P[7:0]=A5h, 5Ah, F0h or 0Fh can make this mode continue and reduce the next 4READ instruction. Once P[7:4] is no longer toggling with P[3:0]; likewise P[7:0]=FFh, 00h, AAh or 55h. And afterwards CS# is raised and then lowered, the system then will escape from performance enhance mode and return to normal operation.

While Program/Erase/Write Status Register cycle is in progress, 4READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

**(11) Sector Erase (SE)**

The Sector Erase (SE) instruction is for erasing the data of the chosen sector to be "1". The instruction is used for any 4K-byte sector. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Sector Erase (SE). Any address of the sector (see ["Table 4. Memory Organization \(16Mb\)"](#)) is a valid address for Sector Erase (SE) instruction. The CS# must go high exactly at the byte boundary (the eighth bit of last address byte been latched-in); otherwise, the instruction will be rejected and not executed.

Address bits [Am-A12] (Am is the most significant address) select the sector address.

The sequence of issuing SE instruction is: CS# goes low→sending SE instruction code→ 3-byte address on SI →CS# goes high. (Please refer to ["Figure 22. Sector Erase \(SE\) Sequence \(Command 20\)"](#))

The self-timed Sector Erase Cycle time (tSE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be check out during the Sector Erase cycle is in progress. The WIP sets 1 during the tSE timing, and sets 0 when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP3, BP2, BP1, BP0 bits, the Sector Erase (SE) instruction will not be executed on the page.

**(12) Block Erase (BE)**

The Block Erase (BE) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 64K-byte block erase operation. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE). Any address of the block (see table 4) is a valid address for Block Erase (BE) instruction. The CS# must go high exactly at the byte boundary (the eighth bit of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE instruction is: CS# goes low→sending BE instruction code→ 3-byte address on SI →CS# goes high. (Please refer to ["Figure 23. Block Erase \(BE\) Sequence \(Command D8\)"](#))

The self-timed Block Erase Cycle time (tBE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be check out during the Sector Erase cycle is in progress. The WIP sets 1 during the tBE timing, and sets 0 when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP3, BP2, BP1, BP0 bits, the Block Erase (BE) instruction will not be executed on the page.

**(13) Chip Erase (CE)**

The Chip Erase (CE) instruction is for erasing the data of the whole chip to be "1". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Chip Erase (CE). The CS# must go high exactly at the byte boundary( the eighth bit of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing CE instruction is: CS# goes low→ sending CE instruction code→CS# goes high. (Please refer to ["Figure 24. Chip Erase \(CE\) Sequence \(Command 60 or C7\)"](#))

The self-timed Chip Erase Cycle time (tCE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be check out during the Chip Erase cycle is in progress. The WIP sets 1 during the tCE timing, and sets 0 when Chip Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the chip is protected by BP3, BP2, BP1, BP0 bits, the Chip Erase (CE) instruction will not be executed. It will be only executed when BP2, BP1, BP0 all set to "0".

**(14) Page Program (PP)**

The Page Program (PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Page Program (PP). The device programs only the last 256 data bytes sent to the device. If the entire 256 data bytes are going to be programmed, A7-A0 (The eight least significant address bits) should be set to 0. If the eight least significant address bits (A7-A0) are not all 0, all transmitted data going beyond the end of the current page are programmed from the start address of the same page (from the address A7-A0 are all 0). If more than 256 bytes are sent to the device, the data of the last 256-byte is programmed at the request page and previous data will be disregarded. If less than 256 bytes are sent to the device, the data is programmed at the requested address of the page without effect on other address of the same page.

The sequence of issuing PP instruction is: CS# goes low→sending PP instruction code→ 3-byte address on SI→ at least 1-byte on data on SI→ CS# goes high. (Please refer to ["Figure 20. Page Program \(PP\) Sequence \(Command 02\)"](#))

The CS# must be kept to low during the whole Page Program cycle; The CS# must go high exactly at the byte boundary (the eighth bit of data being latched in), otherwise the instruction will be rejected and will not be executed.

The self-timed Page Program Cycle time (t<sub>PP</sub>) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be check out during the Page Program cycle is in progress. The WIP sets 1 during the t<sub>PP</sub> timing, and sets 0 when Page Program Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP3, BP2, BP1, BP0 bits, the Page Program (PP) instruction will not be executed.

**(15) 4 x I/O Page Program (4PP)**

The Quad Page Program (4PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit and Quad Enable (QE) bit must be set to "1" before sending the Quad Page Program (4PP). The Quad Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3, which can raise programmer performance and the effectiveness of application of lower clock less than 85MHz. For system with faster clock, the Quad page program cannot provide more actual favors, because the required internal page program time is far more than the time data flows in. Therefore, we suggest that while executing this command (especially during sending data), user can slow the clock speed down to 85MHz below. The other function descriptions are as same as standard page program.

The sequence of issuing 4PP instruction is: CS# goes low→ sending 4PP instruction code→ 3-byte address on SIO[3:0]→at least 1-byte on data on SIO[3:0]→CS# goes high. (Please refer to ["Figure 21. 4 x I/O Page Program \(4PP\) Sequence \(Command 38\)"](#))

**(16) Deep Power-down (DP)**

The Deep Power-down (DP) instruction is for setting the device on the minimizing the power consumption (to entering the Deep Power-down mode), the standby current is reduced from ISB1 to ISB2). The Deep Power-down mode requires the Deep Power-down (DP) instruction to enter, during the Deep Power-down mode, the device is not active and all Write/Program/Erase instruction are ignored. When CS# goes high, it's only in standby mode not deep power-down mode. It's different from Standby mode.

The sequence of issuing DP instruction is: CS# goes low→ sending DP instruction code→ CS# goes high. (Please refer to ["Figure 25. Deep Power-down \(DP\) Sequence \(Command B9\)"](#))

Once the DP instruction is set, all instruction will be ignored except the Release from Deep Power-down mode (RDP) and Read Electronic Signature (RES) instruction. (those instructions allow the ID being reading out). When Power-down, the deep power-down mode automatically stops, and when power-up, the device automatically is in standby mode. For RDP instruction the CS# must go high exactly at the byte boundary (the latest eighth bit of instruction code been latched-in); otherwise, the instruction will not executed. As soon as Chip Select (CS#) goes high, a delay of tDP is required before entering the Deep Power-down mode and reducing the current to ISB2.

**(17) Release from Deep Power-down (RDP), Read Electronic Signature (RES)**

The Release from Deep Power-down (RDP) instruction is terminated by driving Chip Select (CS#) High. When Chip Select (CS#) is driven High, the device is put in the Stand-by Power mode. If the device was not previously in the Deep Power-down mode, the transition to the Stand-by Power mode is immediate. If the device was previously in the Deep Power-down mode, though, the transition to the Stand-by Power mode is delayed by tRES2, and Chip Select (CS#) must remain High for at least tRES2(max), as specified in Table 10. AC Characteristics. Once in the Stand-by Power mode, the device waits to be selected, so that it can receive, decode and execute instructions. The RDP instruction is only for releasing from Deep Power Down mode.

RES instruction is for reading out the old style of 8-bit Electronic Signature, whose values are shown as table of ID Definitions. This is not the same as RDID instruction. It is not recommended to use for new design. For new design, please use RDID instruction. Even in Deep power-down mode, the RDP and RES are also allowed to be executed, only except the device is in progress of program/erase/write cycle; there's no effect on the current program/erase/write cycle in progress.

The sequence is shown as ["Figure 26. Read Electronic Signature \(RES\) Sequence \(Command AB\)"](#), ["Figure 27. Release from Deep Power-down \(RDP\) Sequence \(Command AB\)"](#).

The RES instruction is ended by CS# goes high after the ID been read out at least once. The ID outputs repeatedly if continuously send the additional clock cycles on SCLK while CS# is at low. If the device was not previously in Deep Power-down mode, the device transition to standby mode is immediate. If the device was previously in Deep Power-down mode, there's a delay of tRES2 to transit to standby mode, and CS# must remain to high at least tRES2(max). Once in the standby mode, the device waits to be selected, so it can be receive, decode, and execute instruction.

**(18) Read Electronic Manufacturer ID & Device ID (REMS), (REMS2), (REMS4)**

The REMS, REMS2 & REMS4 instruction is an alternative to the Release from Power-down/Device ID instruction that provides both the JEDEC assigned manufacturer ID and the specific device ID. The REMS4 instruction is recommended to use for 4 I/O identification.

The REMS, REMS2 & REMS4 instruction is very similar to the Release from Power-down/Device ID instruction. The instruction is initiated by driving the CS# pin low and shift the instruction code "90h" or "EFh" or "DFh" followed by two dummy bytes and one bytes address (A7~A0). After which, the Manufacturer ID for Macronix (C2h) and the Device ID are shifted out on the falling edge of SCLK with most significant bit (MSB) first as shown in ["Figure 28. Read Electronic Manufacturer & Device ID \(REMS\) Sequence \(Command 90 or EF or DF\)"](#). The Device ID values are listed in ["Table 7. ID Definitions"](#). If the one-byte address is initially set to 01h, then the device ID will be read first and then followed by the Manufacturer ID. The Manufacturer and Device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

**Table 7. ID Definitions**

RDID Command	manufacturer ID	memory type	memory density
	C2	25	15
RES Command	electronic ID		
	25		
REMS/REMS2/REMS4 Command	manufacturer ID	device ID	
	C2	25	

**(19) Enter Secured OTP (ENSO)**

The ENSO instruction is for entering the additional 512-bit secured OTP mode. The additional 512-bit secured OTP is independent from main array, which may use to store unique serial number for system identifier. After entering the Secured OTP mode, and then follow standard read or program, procedure to read out the data or update data. The Secured OTP data cannot be updated again once it is lock-down.

The sequence of issuing ENSO instruction is: CS# goes low→ sending ENSO instruction to enter Secured OTP mode→ CS# goes high.

Please note that WRSR/WRSCUR commands are not acceptable during the access of secure OTP region, once security OTP is lock down, only read related commands are valid.

**(20) Exit Secured OTP (EXSO)**

The EXSO instruction is for exiting the additional 512-bit secured OTP mode.

The sequence of issuing EXSO instruction is: CS# goes low→sending EXSO instruction to exit Secured OTP mode→ CS# goes high.

**(21) Read Security Register (RDSCUR)**

The RDSCUR instruction is for reading the value of Security Register bits. The Read Security Register can be read at any time (even in program/erase/write status register/write security register condition) and continuously.

The sequence of issuing RDSCUR instruction is: CS# goes low→ sending RDSCUR instruction →Security Register data out on SO→ CS# goes high.

The definition of the Security Register bits is as below:

**Secured OTP Indicator bit.** The Secured OTP indicator bit shows the chip is locked by factory before ex- factory or not. When it is "0", it indicates non-factory lock; "1" indicates factory- lock.

**Lock-down Secured OTP (LDSO) bit.** By writing WRSCUR instruction, the LDSO bit may be set to "1" for customer lock-down purpose. However, once the bit is set to "1" (lock-down), the LDSO bit and the 512-bit Secured OTP area cannot be update any more. While it is in 512-bit secured OTP mode, main array access is not allowed.

**Table 8. Security Register Definition**

bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
x	x	x	x	x	x	LDSO (indicate if lock-down)	Secured OTP indicator bit
reserved	reserved	reserved	reserved	reserved	reserved	0 = not lock-down 1 = lock-down (cannot program/erase OTP)	0 = non-factory lock 1 = factory lock
volatile bit	volatile bit	volatile bit	volatile bit	volatile bit	volatile bit	non-volatile bit	non-volatile bit

**(22) Write Security Register (WRSCUR)**

The WRSCUR instruction is for changing the values of Security Register Bits. Unlike write status register, the WREN instruction is not required before sending WRSCUR instruction. The WRSCUR instruction may change the values of bit1 (LDSO bit) for customer to lock-down the 512-bit Secured OTP area. Once the LDSO bit is set to "1", the Secured OTP area cannot be updated any more.

The sequence of issuing WRSCUR instruction is :CS# goes low→ sending WRSCUR instruction → CS# goes high.

The CS# must go high exactly at the boundary; otherwise, the instruction will be rejected and not executed.

**POWER-ON STATE**

The device is at below states when power-up:

- Standby mode ( please note it is not deep power-down mode)
- Write Enable Latch (WEL) bit is reset

The device must not be selected during power-up and power-down stage unless the VCC achieves below correct level:

- VCC minimum at power-up stage and then after a delay of tVSL
- GND at power-down

Please note that a pull-up resistor on CS# may ensure a safe and proper power-up/down level.

An internal power-on reset (POR) circuit may protect the device from data corruption and inadvertent data change during power up state.

For further protection on the device, if the VCC does not reach the VCC minimum level, the correct operation is not guaranteed. The read, write, erase, and program command should be sent after the time delay:

- tVSL after VCC reached VCC minimum level

The device can accept read command after VCC reached VCC minimum and a time delay of tVSL.

Please refer to the figure of "power-up timing".

Note:

- To stabilize the VCC level, the VCC rail decoupled by a suitable capacitor close to package pins is recommended. (generally around 0.1uF)

**ELECTRICAL SPECIFICATIONS**

**ABSOLUTE MAXIMUM RATINGS**

RATING		VALUE
Ambient Operating Temperature	Industrial grade	-40°C to 85°C
Storage Temperature		-55°C to 125°C
Applied Input Voltage		-0.5V to 4.6V
Applied Output Voltage		-0.5V to 4.6V
VCC to Ground Potential		-0.5V to 4.6V

NOTICE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is stress rating only and functional operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.
2. Specifications contained within the following tables are subject to change.
3. During voltage transitions, all pins may overshoot Vss to -2.0V and Vcc to +2.0V for periods up to 20ns, see "Figure 2. Maximum Negative Overshoot Waveform", "Figure 3. Maximum Positive Overshoot Waveform".

**Figure 2. Maximum Negative Overshoot Waveform**

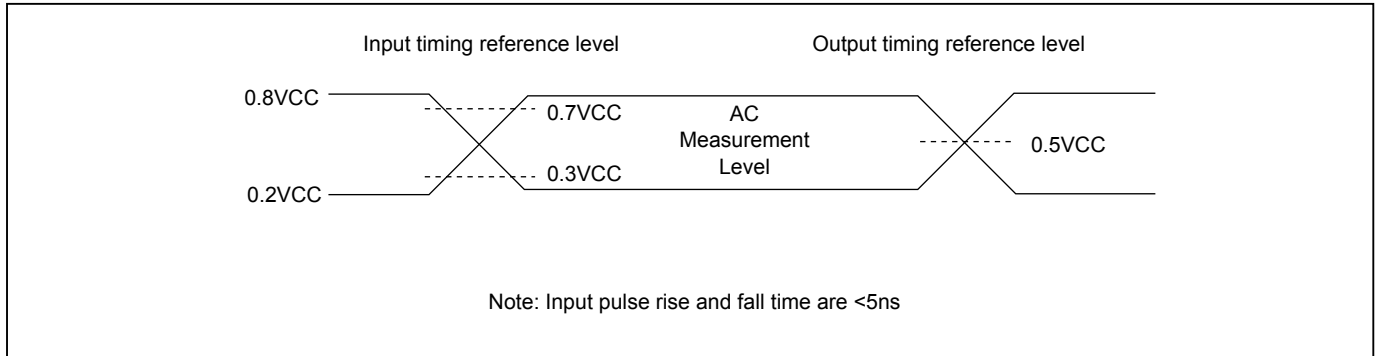

**Figure 3. Maximum Positive Overshoot Waveform**

**CAPACITANCE TA = 25°C, f = 1.0 MHz**

Symbol	Parameter	Min.	Typ.	Max.	Unit	Conditions
CIN	Input Capacitance			6	pF	VIN = 0V
COUT	Output Capacitance			8	pF	VOUT = 0V

**Figure 4. INPUT TEST WAVEFORMS AND MEASUREMENT LEVEL**

**Figure 5. OUTPUT LOADING**

**Table 9. DC CHARACTERISTICS (Temperature = -40°C to 85°C for Industrial grade, VCC = 2.7V ~ 3.6V)**

Symbol	Parameter	Notes	Min.	Typ.	Max.	Units	Test Conditions	
ILI	Input Load Current	1			± 2	uA	VCC = VCC Max, VIN = VCC or GND	
ILO	Output Leakage Current	1			± 2	uA	VCC = VCC Max, VOUT = VCC or GND	
ISB1	VCC Standby Current	1		20	50	uA	VIN = VCC or GND, CS# = VCC	
ISB2	Deep Power-down Current			3	20	uA	VIN = VCC or GND, CS# = VCC	
ICC1	VCC Read	1				35	mA	f=133MHz, fT=133MHz(Dual output read) fQ=133MHz (4 x I/O read) SCLK=0.1VCC/0.9VCC, SO=Open
						25	mA	fT=108MHz (2 x I/O read) SCLK=0.1VCC/0.9VCC, SO=Open
						10	mA	f=50MHz, SCLK=0.1VCC/0.9VCC, SO=Open
ICC2	VCC Program Current (PP)	1			20	mA	Program in Progress, CS# = VCC	
ICC3	VCC Write Status Register (WRSR) Current				20	mA	Program status register in progress, CS#=VCC	
ICC4	VCC Sector Erase Current (SE)	1			20	mA	Erase in Progress, CS#=VCC	
ICC5	VCC Chip Erase Current (CE)	1			20	mA	Erase in Progress, CS#=VCC	
VIL	Input Low Voltage		-0.5		0.3VCC	V		
VIH	Input High Voltage		0.7VCC		VCC+0.4	V		
VOL	Output Low Voltage				0.4	V	IOL = 1.6mA	
VOH	Output High Voltage		VCC-0.2			V	IOH = -100uA	

Notes :

1. Typical values at VCC = 3.3V, T = 25°C. These currents are valid for all product versions (package and speeds).
2. Typical value is calculated by simulation.
3. It is measured under checkboard pattern.

**Table 10. AC CHARACTERISTICS (Temperature = -40°C to 85°C for Industrial grade, VCC = 2.7V ~ 3.6V)**

Symbol	Alt.	Parameter	Min.	Typ.	Max.	Unit
fSCLK	fC	Clock Frequency for the following instructions: FAST_READ, PP, SE, BE, CE, DP, RES,RDP WREN, WRDI, RDID, RDSR, WRSR	D.C.		133	MHz
fRSCLK	fR	Clock Frequency for READ instructions			50	MHz
fTCLK	fT	Clock Frequency	2READ		108	MHz
			DREAD		133	MHz
	fQ	Clock Frequency for 4READ instructions			133	MHz
f4PP		Clock Frequency for 4PP (Quad page program)	2.7V-3.6V		85	MHz
			3.0V-3.6V		104	MHz
tCH(1)	tCLH	Clock High Time	133MHz	3.3		ns
			108MHz (2READ)	4.5		ns
			Normal Read	9		ns
			4PP	5.5		ns
tCL(1)	tCLL	Clock Low Time	133MHz	3.3		ns
			108MHz (2READ)	4.5		ns
			Normal Read	9		ns
			4PP	5.5		ns
tCLCH(2)		Clock Rise Time (3) (peak to peak)	0.1			V/ns
tCHCL(2)		Clock Fall Time (3) (peak to peak)	0.1			V/ns
tSLCH	tCSS	CS# Active Setup Time (relative to SCLK)	3			ns
tCHSL		CS# Not Active Hold Time (relative to SCLK)	3			ns
tDVCH	tDSU	Data In Setup Time	2			ns
tCHDX	tDH	Data In Hold Time	2			ns
tCHSH		CS# Active Hold Time (relative to SCLK)	3			ns
tSHCH		CS# Not Active Setup Time (relative to SCLK)	3			ns
tSHSL(3)	tCSH	CS# Deselect Time	Read	15		ns
			Write/Erase/Program	50		ns
tSHQZ(2)	tDIS	Output Disable Time	2.7V-3.6V		9	ns
			3.0V-3.6V		9	ns
tCLQV	tV	Clock Low to Output Valid	Loading: 10pF, VCC=2.7V~3.6V		6.5	ns
			Loading: 15pF, VCC=3.0V~3.6V		6	ns
tCLQX	tHO	Output Hold Time	1			ns
tWHSL		Write Protect Setup Time	20			ns
tSHWL		Write Protect Hold Time	100			ns
tDP(2)		CS# High to Deep Power-down Mode			10	us
tRES1(2)		CS# High to Standby Mode without Electronic Signature Read			20	us
tRES2(2)		CS# High to Standby Mode with Electronic Signature Read			20	us
tW		Write Status Register Cycle Time		40	100	ms
tBP		Byte-Program		9	300	us
tPP		Page Program Cycle Time		0.7	3	ms
tSE		Sector Erase Cycle Time		60	300	ms
tBE		Block Erase Cycle Time		0.4	2.2	s
tCE		Chip Erase Cycle Time		6	30	s

Notes:

1. tCH + tCL must be greater than or equal to 1/ f (fC or fT or fQ or fR or f4PP).
2. Value guaranteed by characterization, not 100% tested in production.
3. Only applicable as a constraint for a WRSR instruction when SRWD is set at 1.

**Timing Analysis**

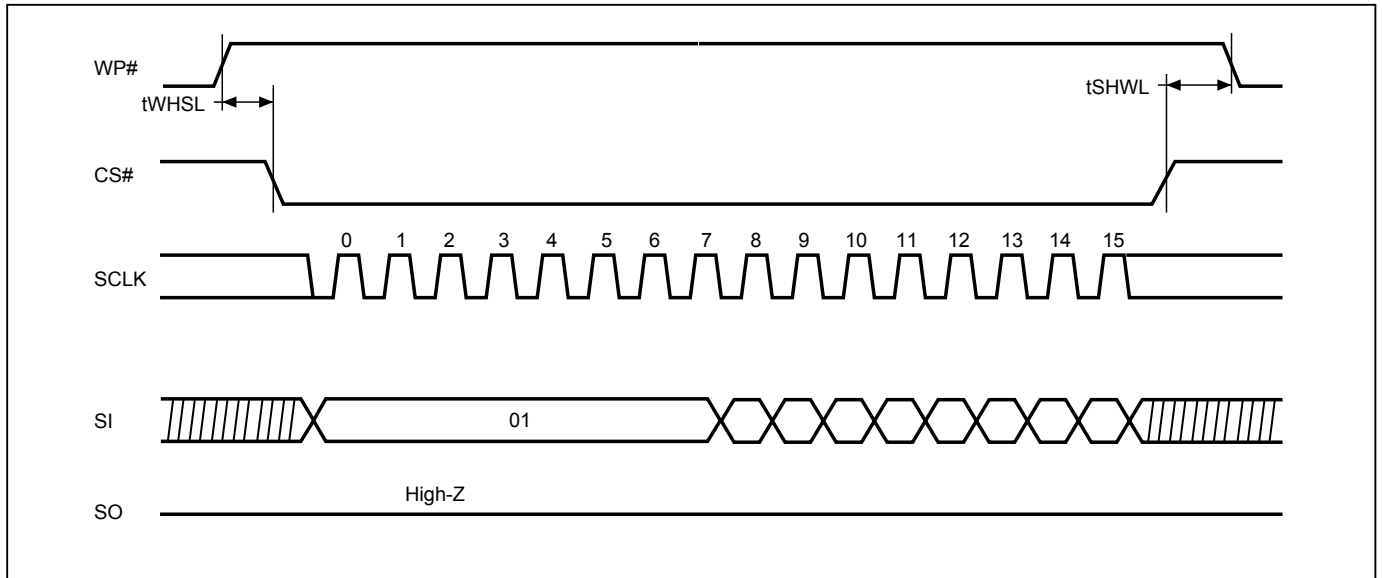

**Figure 6. Serial Input Timing**

**Figure 7. Output Timing**

**Figure 8. WP# Setup Timing and Hold Timing during WRSR when SRWD=1**

**Figure 9. Write Enable (WREN) Sequence (Command 06)**

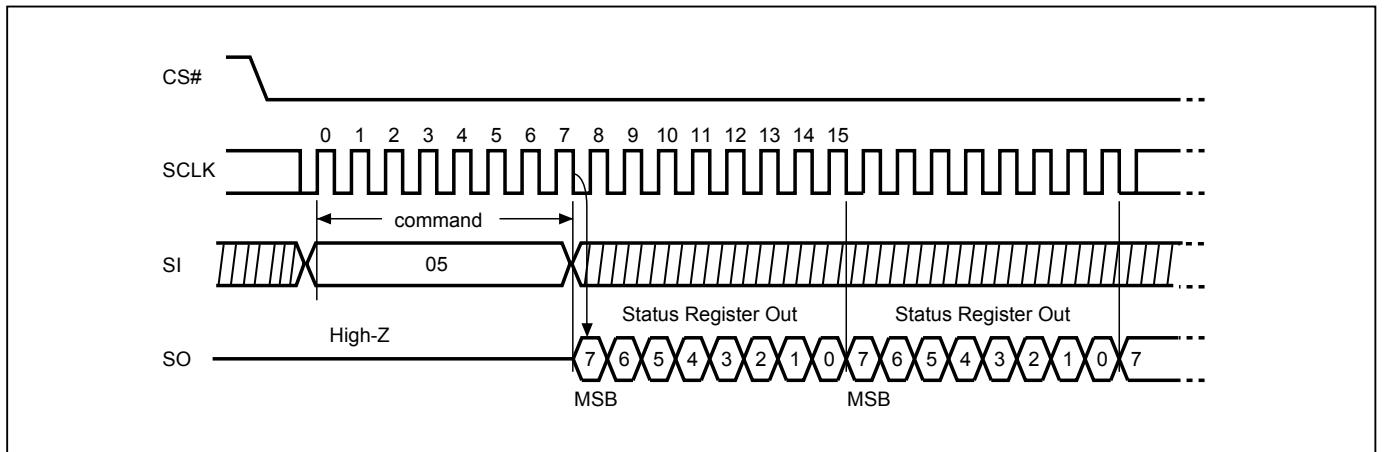

**Figure 10. Write Disable (WRDI) Sequence (Command 04)**

**Figure 11. Read Identification (RDID) Sequence (Command 9F)**

**Figure 12. Read Status Register (RDSR) Sequence (Command 05)**

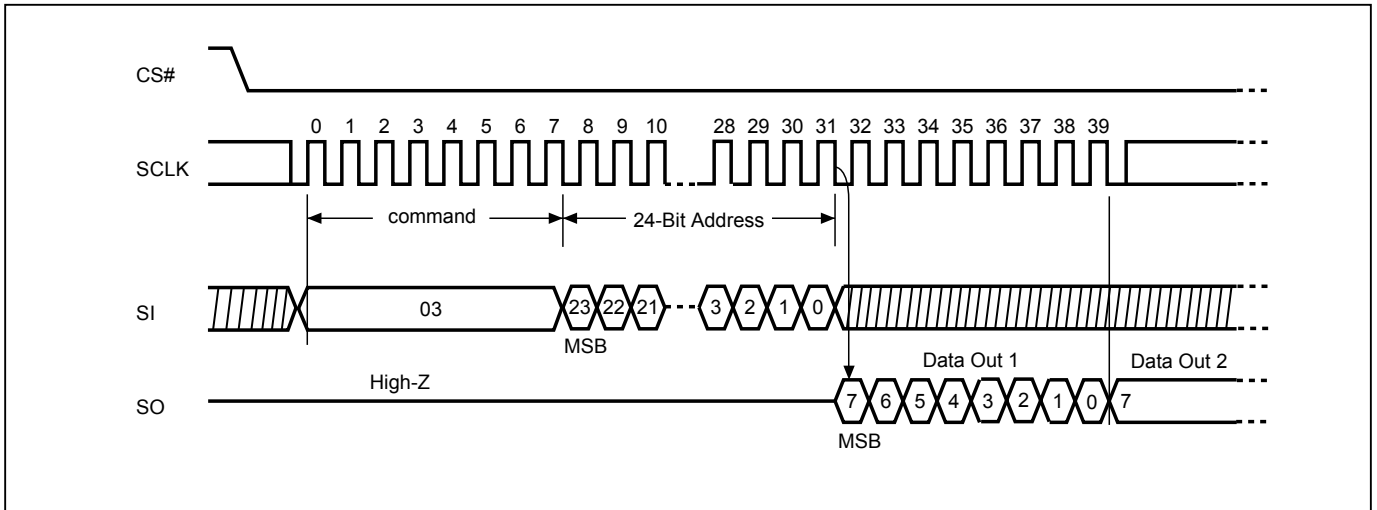

**Figure 13. Write Status Register (WRSR) Sequence (Command 01)**

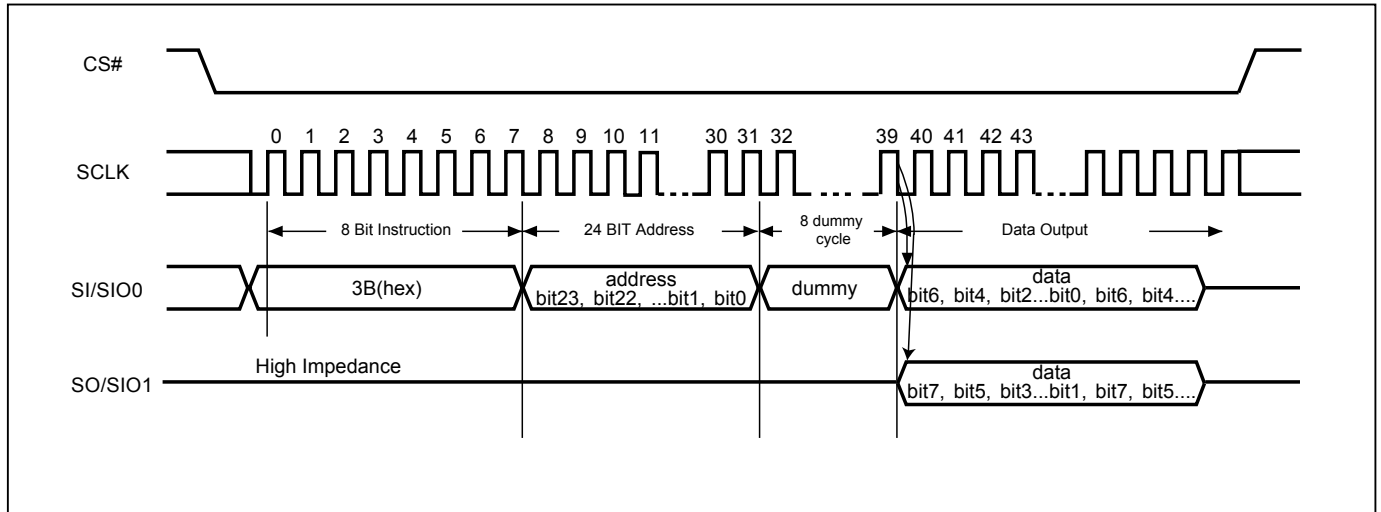

**Figure 14. Read Data Bytes (READ) Sequence (Command 03)**

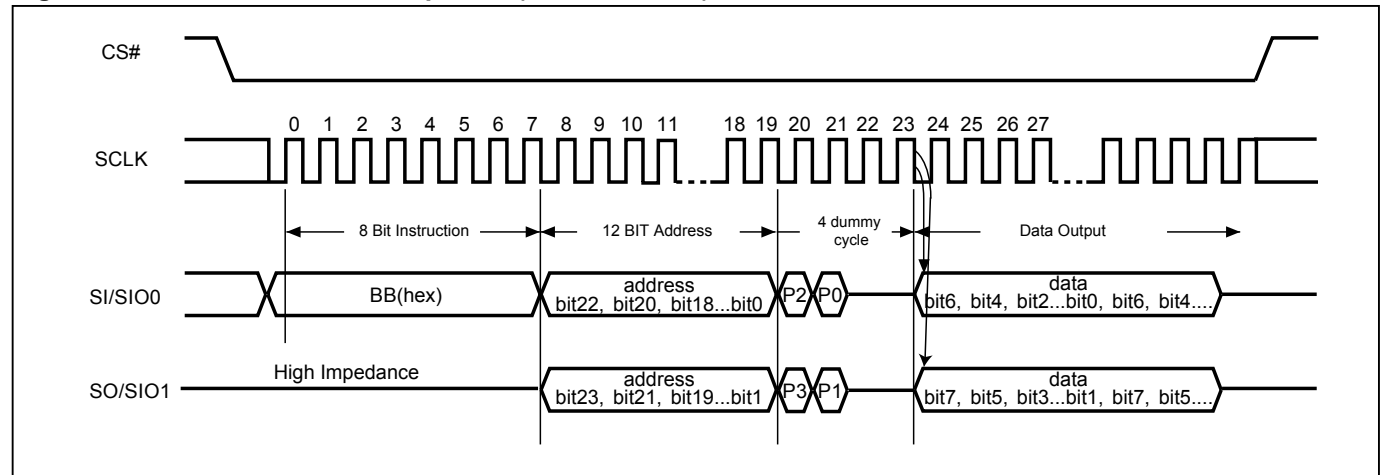

**Figure 15. Read at Higher Speed (FAST\_READ) Sequence (Command 0B)**

**Figure 16. Dual Read Mode Sequence (Command 3B)**

**Figure 17. 2 x I/O Read Mode Sequence (Command BB)**

**Note:**

1. SI/SIO0 or SO/SIO1 should be kept "00" or "11" in the first 2 dummy cycles.  
In other words, P2=P0 or P3=P1 is necessary.

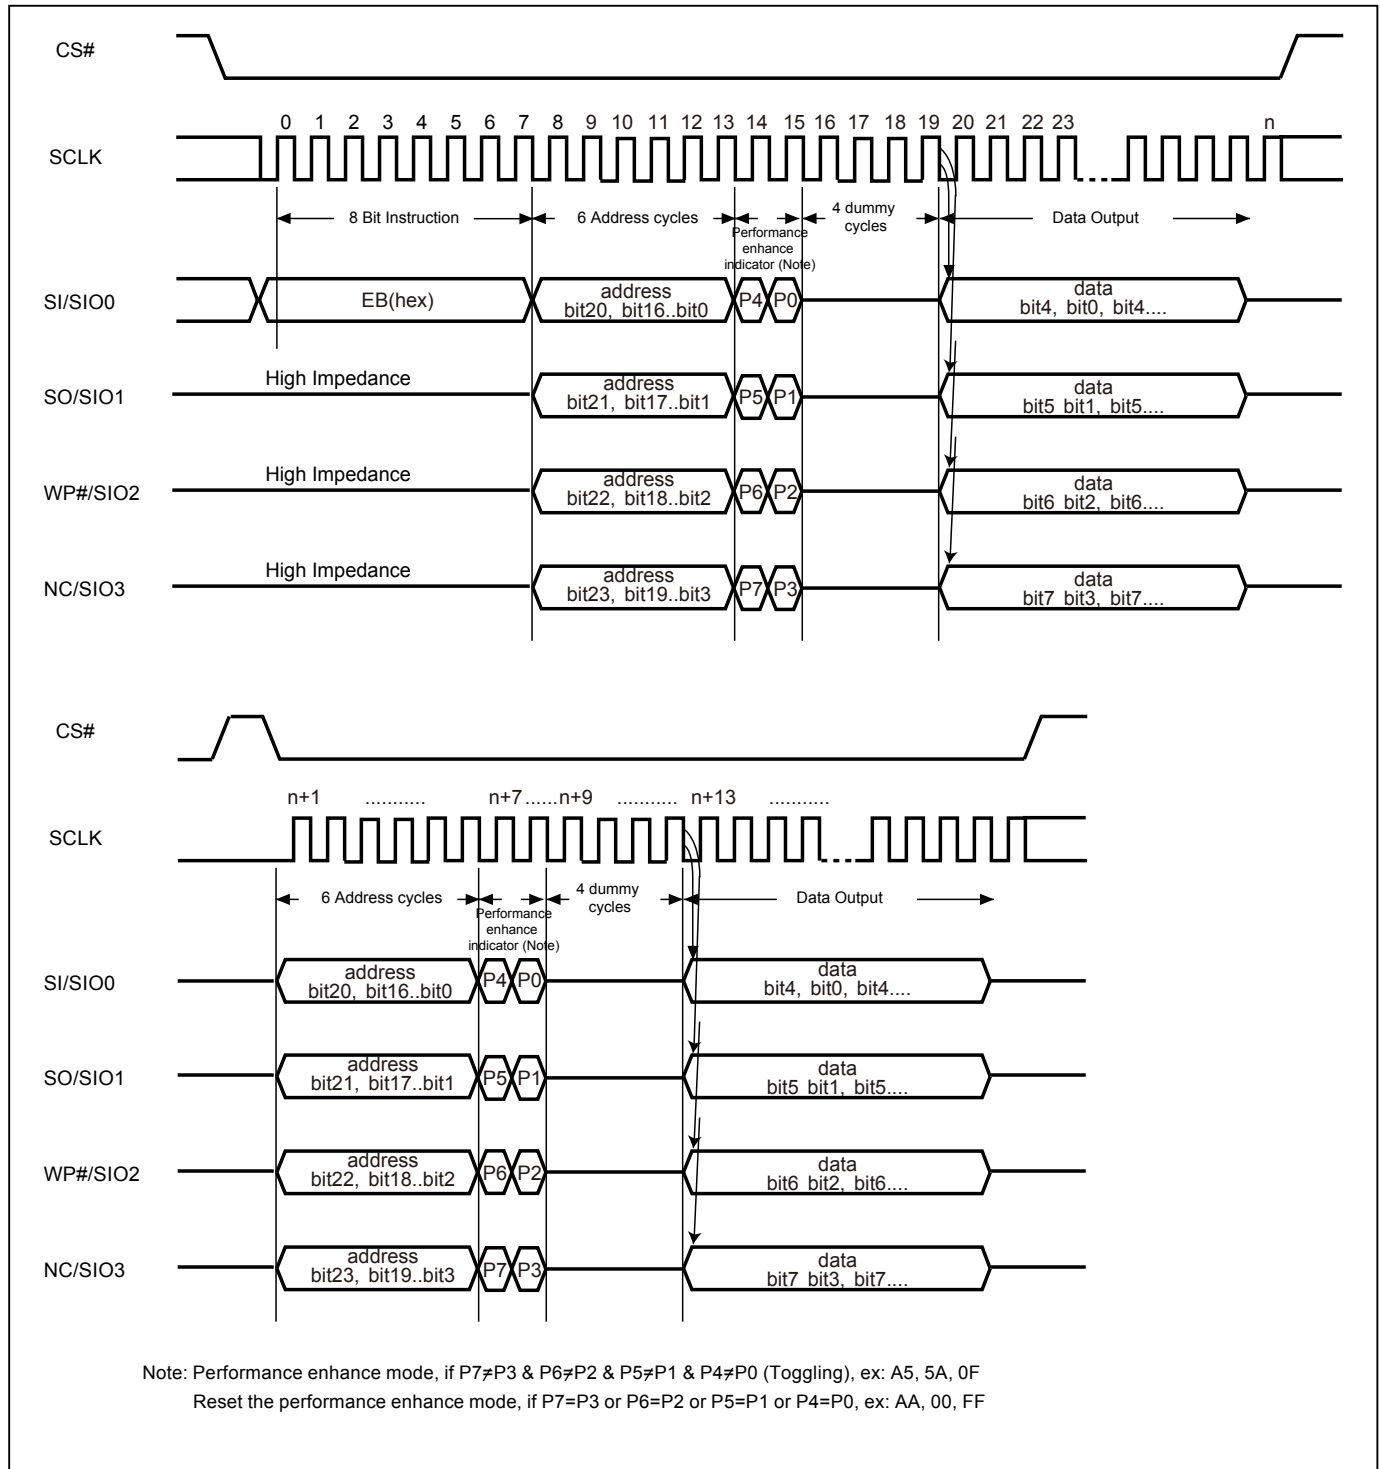

**Figure 18. 4 x I/O Read Mode Sequence (Command EB)**

**Note:**

1. Hi-impedance is inhibited for the two clock cycles.
2. P7≠P3, P6≠P2, P5≠P1 & P4≠P0 (Toggling) will result in entering the performance enhance mode.

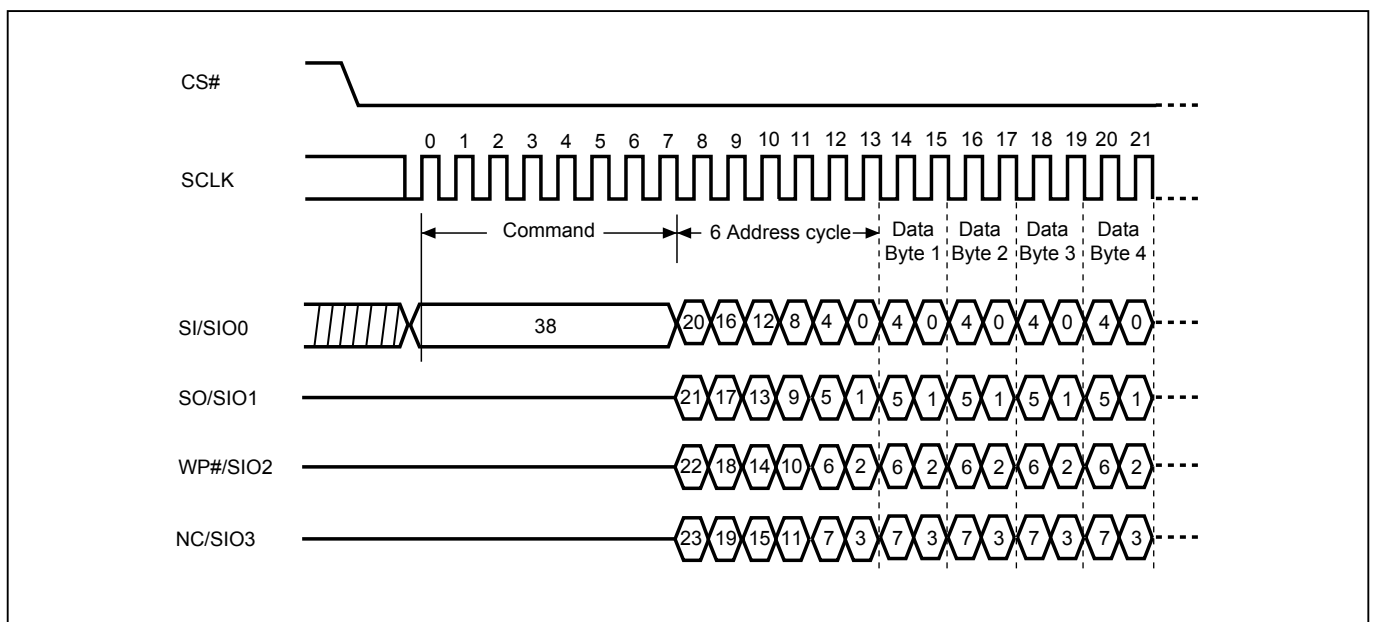

Figure 19. 4 x I/O Read enhance performance Mode Sequence (Command EB)

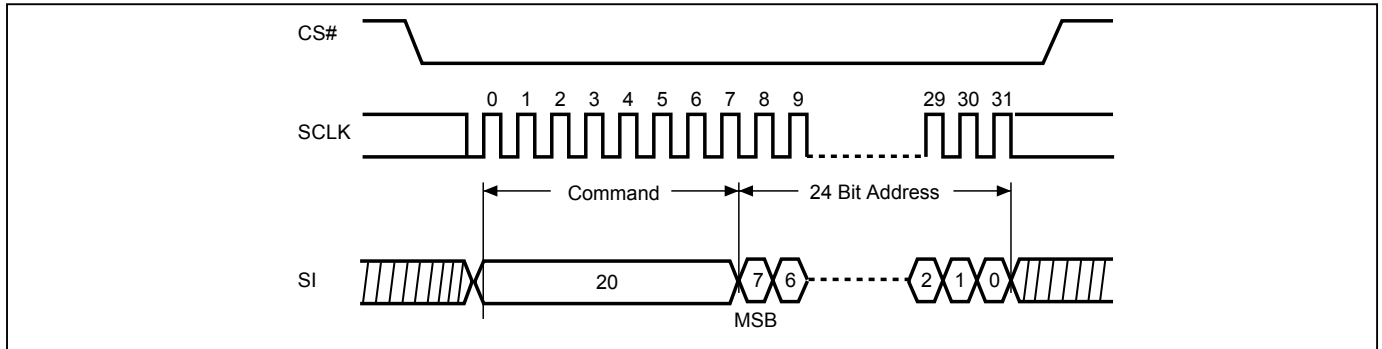

**Figure 20. Page Program (PP) Sequence (Command 02)**

**Figure 21. 4 x I/O Page Program (4PP) Sequence (Command 38)**

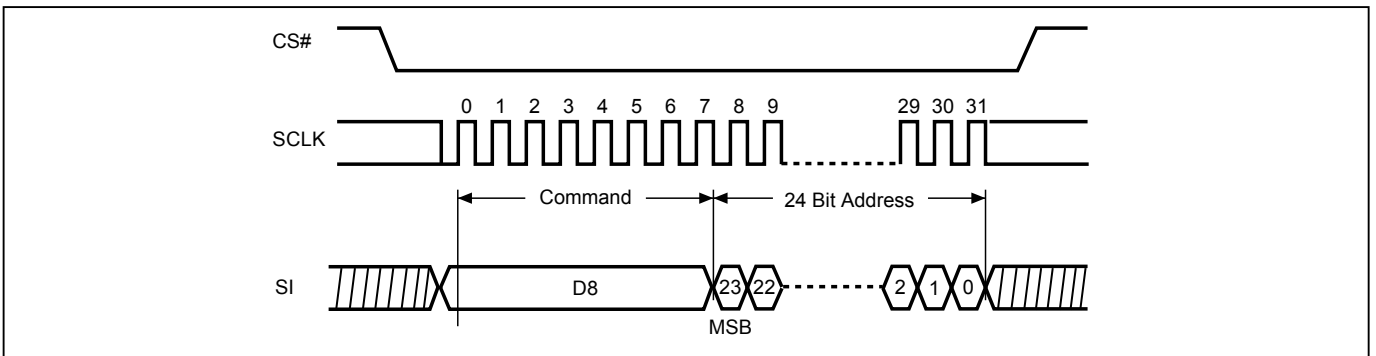

**Figure 22. Sector Erase (SE) Sequence (Command 20)**

Note: SE command is 20(hex).

**Figure 23. Block Erase (BE) Sequence (Command D8)**

Note: BE command is D8(hex).

**Figure 24. Chip Erase (CE) Sequence (Command 60 or C7)**

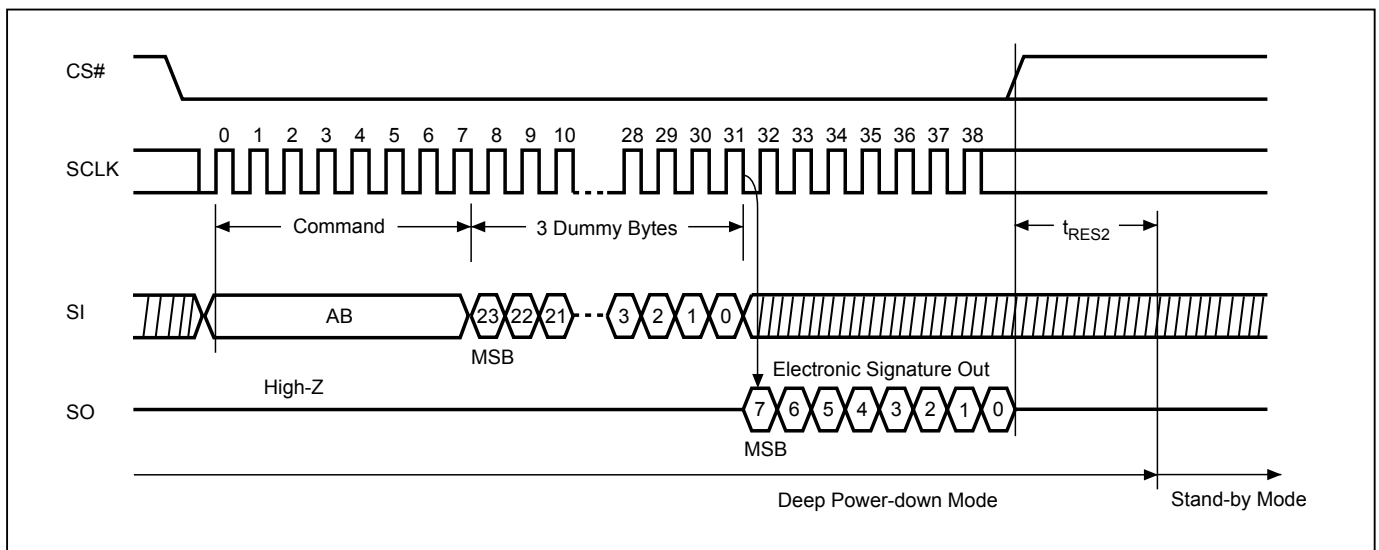

Note: CE command is 60(hex) or C7(hex).

**Figure 25. Deep Power-down (DP) Sequence (Command B9)**

**Figure 26. Read Electronic Signature (RES) Sequence (Command AB)**

**Figure 27. Release from Deep Power-down (RDP) Sequence (Command AB)**

**Figure 28. Read Electronic Manufacturer & Device ID (REMS) Sequence (Command 90 or EF or DF)**

**Notes:**

- (1) ADD=00H will output the manufacturer's ID first and ADD=01H will output device ID first
- (2) Instruction is either 90(hex) or EF(hex) or DF(hex).

**Figure 29. Power-up Timing**

Note: VCC (max.) is 3.6V and VCC (min.) is 2.7V.

**Table 11. Power-Up Timing**

Symbol	Parameter	Min.	Max.	Unit
tVSL(1)	VCC(min) to CS# low	300		us

Note: 1. The parameter is characterized only.

**INITIAL DELIVERY STATE**

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFh). The Status Register contains 00h (all Status Register bits are 0).

## OPERATING CONDITIONS

### At Device Power-Up and Power-Down

AC timing illustrated in "Figure 30. AC Timing at Device Power-Up" and "Figure 31. Power-Down Sequence" are for the supply voltages and the control signals at device power-up and power-down. If the timing in the figures is ignored, the device will not operate correctly.

During power-up and power down, CS# needs to follow the voltage applied on VCC to keep the device not to be selected. The CS# can be driven low when VCC reach  $V_{CC(min)}$  and wait a period of  $t_{VSL}$ .

**Figure 30. AC Timing at Device Power-Up**

Symbol	Parameter	Notes	Min.	Max.	Unit
tVR	VCC Rise Time	1	20	500000	us/V

Notes :

1. Sampled, not 100% tested.
2. For AC spec  $t_{CHSL}$ ,  $t_{SLCH}$ ,  $t_{DVCH}$ ,  $t_{CHDX}$ ,  $t_{SHSL}$ ,  $t_{CHSH}$ ,  $t_{SHCH}$ ,  $t_{CHCL}$ ,  $t_{CLCH}$  in the figure, please refer to "Table 10. AC CHARACTERISTICS (Temperature = -40°C to 85°C for Industrial grade, VCC = 2.7V ~ 3.6V)".

**Figure 31. Power-Down Sequence**

During power-down, CS# needs to follow the voltage drop on VCC to avoid mis-operation.

**ERASE AND PROGRAMMING PERFORMANCE**

Parameter	Min.	Typ. (1)	Max. (2)	Unit
Write Status Register Cycle Time		40	100	ms
Sector Erase Cycle Time		60	300	ms
Block Erase Cycle Time		0.4	2.2	s
Chip Erase Cycle Time		6	30	s
Byte Program Time (via page program command)		9	300	us
Page Program Cycle Time		0.7	3	ms
Erase/Program Cycle		100,000		cycles

## Note:

1. Typical program and erase time assumes the following conditions: 25°C, 3.3V, and checker board pattern.
2. Under worst conditions of 85°C and 2.7V.
3. System-level overhead is the time required to execute the first-bus-cycle sequence for the programming command.
4. Erase/Program cycles comply with JEDEC JESD-47 & JESD22-A117 standard.

**DATA RETENTION**

Parameter	Condition	Min.	Max.	Unit
Data retention	55°C	20		years

**LATCH-UP CHARACTERISTICS**

	Min.	Max.
Input Voltage with respect to GND on all power pins, SI, CS#	-1.0V	2 VCCmax
Input Voltage with respect to GND on SO	-1.0V	VCC + 1.0V
Current	-100mA	+100mA

Includes all pins except VCC. Test conditions: VCC = 3.0V, one pin at a time.

**ORDERING INFORMATION**

PART NO.	CLOCK (MHz)	TEMPERATURE	PACKAGE	Remark
MX25L1636EM2I-08G	133	-40°C~85°C	8-SOP (200mil)	RoHS Compliant

### PART NAME DESCRIPTION

**PACKAGE INFORMATION**

Doc. Title: Package Outline for SOP 8L 200MIL (official name - 209MIL)

**REVISION HISTORY**

<b>Revision No.</b>	<b>Description</b>	<b>Page</b>	<b>Date</b>
1.0	1. Revised Part Number from MX25L1636EM2I-8G to "08G". 2. Modified description wording for "RoHS Compliant" 3. Modified Address range on Table 3. to xxx010~xxx1FF	P45,46 P6,45,46 P11	APR/18/2011
1.1	1. Modified f4PP(Max.) from 33MHz to 85 MHz 2. Modified tCH/tCL 4PP(Min.) from 14ns to 5.5ns 3. Corrected ILO TEST CONDITIONS in Table 9	P21,29 P29 P28	FEB/15/2012
1.2	1. Modified tCHDX(Min.) from 5ns to 3ns 2. Added tCLQV>Loading:15pF, VCC=3.0~3.6V): 6ns 3. Added f4PP=104MHz @VCC=3.0~3.6V	P29 P29 P29	MAR/19/2012
1.3	1. Modified tSLCH, tCHSL, tCHDX, tCHSH, tSHCH time	P29	JUN/13/2012

Except for customized products which has been expressly identified in the applicable agreement, Macronix's products are designed, developed, and/or manufactured for ordinary business, industrial, personal, and/or household applications only, and not for use in any applications which may, directly or indirectly, cause death, personal injury, or severe property damages. In the event Macronix products are used in contradicted to their target usage above, the buyer shall take any and all actions to ensure said Macronix's product qualified for its actual use in accordance with the applicable laws and regulations; and Macronix as well as it's suppliers and/or distributors shall be released from any and all liability arisen therefrom.
